

Shivohini TechAI – Comprehensive Product & Solutions Overview

Company Profile

Shivohini TechAI is a technology company specializing in artificial intelligence (AI) solutions for businesses. Founded in 2025 by Dr. Gunjan Bhatia in Udaipur, India, the company provides customized AI-driven products and services that address real-world business challenges across various industries. Shivohini TechAI operates in India and the Gulf region (including the UAE, Oman, and other Gulf countries), delivering solutions ranging from virtual assistants for public sector services to fraud detection systems in banking. The company's recent focus has expanded to the hospitality sector in the Middle East, where it develops AI-powered "virtual waiter" and guest service automation tools to help hotels and resorts streamline operations and enhance customer experiences.

Founder Background

Dr. Gunjan Bhatia (Founder & CEO): Dr. Bhatia is an academic-turned-entrepreneur with 12+ years of experience at top academic and industry institutions in the US, Germany, and India. She holds a Ph.D. in Financial Markets and has a background in finance, banking, and data analytics. Prior to founding Shivohini TechAI, Dr. Bhatia spent over a decade in academia, gaining extensive teaching and research experience, including research work on AI in Germany. She has also worked as a corporate trainer specializing in data analysis and AI, and is recognized as an international expert speaker on AI. Under her leadership as CEO, she is focused on driving R&D and developing new AI-driven solutions. Dr. Bhatia's journey is a story of persistence and innovation; she established Shivohini TechAI to transform real-world challenges into intelligent solutions, leveraging her expertise to bridge academic insight with practical business applications.

Vision and Mission

Vision: *"Be the premier AI partner for businesses in India and the Gulf, transforming challenges into intelligent solutions that drive growth and social impact."* Shivohini TechAI envisions itself as a leading AI solutions provider, helping organizations turn complex challenges into opportunities through intelligent automation and insights.

Mission: *"Leverage AI to deliver tailored solutions that solve complex problems, streamline operations, and empower organizations in India, the UAE, Saudi Arabia, Qatar, Oman, and the Gulf region."* The company's mission is to apply AI in a customized way for each client – from individual entrepreneurs to large enterprises – to improve efficiency and enable data-driven decision making. In practice, this means building AI systems trained on client-specific data and workflows, ensuring that even small businesses (sole proprietors) can benefit from AI solutions crafted to their needs.

Shivohini TechAI's unique selling proposition (USP) is the customization of AI: solutions are developed from the ground up for each client's domain and scale, rather than one-size-fits-all, thereby solving real-world business problems in a targeted manner.

Products and Solutions

Shivohini TechAI offers a broad range of AI-powered products designed to automate tasks, improve customer engagement, and enhance security for businesses. Its flagship products include AI-driven virtual agents and industry-specific AI applications. Below is an overview of each major product or solution and its operational details:

AI Agent Platform

AI Agent is the core intelligent platform powering many of Shivohini's solutions. It refers to autonomous, conversational AI entities that can perform tasks or services on behalf of humans. These AI agents are goal-driven and can be customized for different operational roles (customer service, sales, analytics, etc.) across industries. Each AI Agent is built on a bespoke AI engine – going beyond generic models like ChatGPT – to ensure domain-specific intelligence and reliability. Key characteristics of the AI Agent platform include:

- **24x7 Autonomy:** Agents operate continuously without human intervention, providing instant responses around the clock (no downtime). This makes them suitable for critical support functions that must be always available.
- **Truly Multilingual:** The AI engine can understand and communicate in any language required, allowing the agent to handle queries from diverse linguistic groups without missing any client query.
- **Seamless Integration:** AI Agents can be embedded into existing websites, apps, or communication channels. They integrate with company databases and CRM systems to pull in relevant information, enabling them to serve customers or staff by accessing real-time data.
- **Adaptive Learning:** Over time, the AI Agent can be trained on new data (such as interaction logs or updated product info) to continually improve its responses and decision-making. It behaves like an intelligent teammate that can execute tasks (not just answer questions) by interfacing with other software systems.

In summary, the AI Agent platform is the foundation for Shivohini's tailored AI solutions. It can be thought of as the "brain" that is configured for various roles described in the products below.

Shivohini Virtual Assistant

The **Shivohini Virtual Assistant** is a conversational AI assistant that serves as a universal helpdesk and customer interface for businesses. It is essentially an AI chat assistant (text and voice enabled) that can be deployed on a company's website or messaging channels to interact with users in a natural, human-like manner. This virtual assistant is one of Shivohini's flagship offerings and is often customized per client to handle domain-specific queries.

- **Customer Support:** The virtual assistant can answer frequently asked questions, guide users to information on the website, assist with bookings or orders, and handle basic troubleshooting. For example, an educational institute's site might have a 24/7 virtual assistant to answer student or parent questions about admissions and courses.
- **Personalized Conversations:** It uses Natural Language Understanding (NLU) to interpret user inquiries and maintain context. It can handle multi-turn conversations, ask clarifying questions, and provide tailored responses based on user data (e.g. greeting a returning customer by name or recommending products based on past purchases).
- **Voice and Text Modes:** Users can either type or speak to the Shivohini Virtual Assistant. In voice mode, the assistant employs speech recognition to understand spoken queries and responds with synthesized speech. It can carry on interactive voice dialogues, making it feel like talking to a human assistant. (Detailed behavior in voice vs text mode is discussed in a later section.)
- **Multi-Channel Presence:** The assistant can be made available on web chat widgets, mobile apps, WhatsApp or other messaging apps, and even via phone lines. This ensures customers can reach it through their preferred channel at any time.
- **Domain Trained:** Unlike generic assistants, the Shivohini Virtual Assistant is trained on the client's own data (product catalogs, policy documents, etc.) and industry knowledge. This bespoke training allows it to answer highly specific questions. For instance, a public services virtual assistant was configured to provide citizens information about government services, while a banking virtual assistant might help users with account queries and even perform tasks like checking balances or flagging fraudulent transactions.
- **Example:** In the **education sector**, the virtual assistant can offer round-the-clock support for students and faculty. A student could ask via chat, "What is the deadline for assignment submission?" and the AI, integrated with the school's system, would answer immediately. Or a parent could use voice on the website to ask "When are parent-teacher meetings scheduled?" and get an instant spoken response. All this reduces the load on human staff by handling routine inquiries.

Overall, the Shivohini Virtual Assistant functions as an intelligent, always-available front desk or helpdesk for any business, improving customer engagement and responsiveness.

AI Sales Person

The **AI Sales Person** (also referred to as an AI Sales Assistant) is a virtual sales representative designed to handle sales and lead generation tasks. This product acts as an automated salesperson that can engage potential customers, pitch products or services, answer product-related questions, and even assist in closing sales or scheduling follow-ups. Shivohini TechAI developed the AI Sales Person especially to help businesses that may not have large sales teams (for example, sole proprietors or

small enterprises) to efficiently handle customer inquiries and online sales conversations.

Operational details of the AI Sales Person include:

- **Lead Engagement:** When a visitor comes to a website or contacts the business (via chat or social media), the AI Sales Person proactively greets them and inquires about their needs. It can ask qualifying questions to understand the customer's requirements. For example, on an e-commerce site, it might ask "Hello! Are you looking for something specific today?" and then guide the conversation based on the user's response.
- **Product Recommendations:** Using stored product knowledge and possibly purchase history, the AI can recommend products or services that match the customer's needs. It can highlight features, compare options, and upsell or cross-sell where appropriate, much like a human sales rep. If a customer is browsing a tech store online and asks, "I need a laptop for gaming under \$1000," the AI Sales Person can list suitable models and their specs.
- **Answering Queries & Objections:** The AI is prepared with answers to common customer questions about products (specifications, stock availability, pricing, warranty, etc.). It can handle objections or concerns by providing additional information. For instance, a customer might say "I'm not sure if this software will integrate with my system," and the AI can respond with integration details or offer a free trial.
- **Closing and Follow-up:** When the customer is ready, the AI Sales Person can guide them through the purchase process (e.g. adding items to cart, collecting shipping information) or schedule a demo/appointment for services. If the user isn't ready to buy immediately, the AI can capture their contact details (becoming a **lead**) and schedule a follow-up call or email. It ensures no lead is dropped – every inquiry gets attention. In fact, one of Shivohini's implementations was an AI Sales Person dedicated to sole business owners, aimed at converting website visitors into customers without the owner needing to be online 24/7.
- **Integration with CRM:** All interactions and captured lead data can be logged into a Customer Relationship Management system. The AI Sales Person updates lead status and can notify a human salesperson for high-value leads or when human intervention is needed (for example, if a conversation is complex or the customer specifically requests to talk to a human).

By handling initial sales conversations and routine inquiries, the AI Sales Person frees up human sales staff to focus on complex deals. It ensures prompt responses to every potential customer, improving sales conversion rates and customer satisfaction.

AI Marketing Manager

The **AI Marketing Manager** is an AI solution that automates and augments marketing tasks for a business. It functions like a digital marketing team member, capable of analyzing customer data, managing outreach campaigns, and optimizing marketing strategy using AI-driven insights. Shivohini's AI Marketing Manager can save

businesses time and effort in managing their marketing funnel by making intelligent, data-driven decisions quickly.

Key operational capabilities include:

- **Customer Data Analysis:** The AI Marketing Manager continuously analyzes customer interaction data (website analytics, social media engagement, purchase history, etc.) to identify trends and segments. It can uncover customer preferences or emerging trends that a business can capitalize on. For example, it might recognize that a certain product is selling more in a particular region or season and flag that for a targeted campaign.
- **Personalized Campaigns:** Using insights from data, the AI can automatically generate customer segments and tailor marketing campaigns to them. It can draft personalized email content or promotional messages for different segments. For instance, loyal customers can receive a special discount offer, whereas new leads get an informational newsletter. The AI ensures the messaging and offers are relevant to the recipient's behavior and history.
- **Automated Outreach:** The system can schedule and send marketing communications through various channels (email, SMS, social media). It determines the optimal timing and frequency based on analytics (e.g., it might send emails at a time the open rate is highest for that user cohort). Additionally, it can interact via chat; for example, an AI Marketing Manager might work alongside a chatbot on a website to offer a promo code to a user who has spent some time browsing, thereby nudging them to make a purchase.
- **Lead Nurturing:** The AI Marketing Manager helps turn prospects into customers by nurturing leads. If someone filled a "Contact Us" form or left an inquiry, the AI can follow up with them. In the education industry use-case, the AI Marketing Assistant (a component of this product) would gather and analyze "Contact Us" inquiries and follow up with prospective students by providing them additional information or inviting them to campus events. Similarly, in other industries, it can send follow-up information or offers to interested prospects to keep them engaged.
- **Loyalty and Retention Marketing:** The AI can identify loyal customers or those with high lifetime value and ensure they receive exclusive deals or engagement. For example, it may automatically detect repeat customers (e.g., a frequent hotel guest or a repeat buyer on an e-commerce site) and send them a personalized thank-you message with a loyalty reward. This "Loyalty Outreach" capability helps improve customer retention by making customers feel valued.
- **Insights & Reporting:** The AI Marketing Manager provides analytics dashboards or summaries that highlight campaign performance and marketing ROI. It can produce visualizations and plain-language reports explaining which campaigns worked best, which customer segment responded most, etc., enabling human marketers to quickly grasp results and plan next actions.

In practice, the AI Marketing Manager works in tandem with human marketing teams. It handles the heavy lifting of data analysis and routine outreach, while humans can focus

on creative strategy and complex decision-making. For instance, Shivohini's AI identified loyal clients in an export-import business and automatically sent them targeted promotions, driving repeat sales without the marketing team manually pulling customer lists. Such automation ensures consistent and timely marketing efforts with minimal manual intervention.

AI Marketing Videos

Shivohini's **AI Marketing Videos** solution uses artificial intelligence to create promotional and marketing video content without the need for traditional video shoots. This product is particularly useful for clients who want to produce engaging video advertisements or informational videos quickly and cost-effectively. By leveraging AI, the system can generate video clips with graphics, animations, or even AI-generated spokespersons, all based on input scripts or content provided by the client.

Operational aspects of AI Marketing Videos include:

- **Template & Avatar-Based Video Generation:** The system may use a library of video templates or AI avatars. A user can provide text (such as a marketing message or product description) and select a style, and the AI will produce a video. For example, it could generate a 60-second promotional video for a new real estate project, showing images of the property while an AI voice (or an on-screen avatar) narrates the key features.
- **No Filming Required:** As noted in Shivohini's project highlights, this solution creates videos that "don't require any shoots". That means clients don't need to gather camera crews or actors; the video content (be it stock footage, animations, or AI-rendered scenes) is synthesized by the AI. This drastically lowers production cost and time.
- **Customization:** The AI allows customization of color schemes, logos, and fonts to ensure the video aligns with the client's branding. It can automatically incorporate the company's branding elements if provided, ensuring consistency across marketing materials.
- **Multiple Formats:** Videos can be produced in various aspect ratios and lengths suitable for different platforms (e.g., shorter videos for social media stories, horizontal videos for YouTube, etc.). The AI can intelligently reformat and edit content for each platform's requirements.
- **Localization:** If needed, the AI Marketing Videos tool can create versions of the video in multiple languages. By leveraging text-to-speech in different languages and translating the captions or content, the same marketing message can reach a broader audience in their native language, without creating separate videos manually.
- **Use Cases:** A typical use case might be a small business launching a new product. Instead of hiring a videographer, they input their product images, a description, and desired style into the AI. The system might generate a dynamic slideshow video with transitions highlighting product benefits, set to background music, with a voice-over generated from the provided script. For a Dubai-based client, Shivohini used this solution to produce marketing videos at a reasonable

cost and quick turnaround. The client received professional-looking videos ready for advertising campaigns without ever setting up a camera.

Overall, AI Marketing Videos democratizes video content creation, enabling businesses of any size to have high-quality video ads and marketing materials on demand. It's especially useful for marketing managers who need to rapidly generate content for A/B testing or seasonal promotions without the overhead of production logistics.

Content Creator

The **Content Creator** is Shivohini TechAI's AI-driven content generation tool. It is designed to create written content and copy tailored to a business's needs, leveraging advanced language models. This tool helps organizations produce blogs, articles, social media posts, product descriptions, and other textual content efficiently, ensuring consistency in tone and messaging.

Key features and operations of the Content Creator include:

- **Natural Language Generation:** At its core, the Content Creator uses AI to generate human-like text. A user can specify the topic, desired length, tone (formal, friendly, technical, etc.), and any key points, and the AI will produce a draft that meets those criteria. For example, a real estate company could ask the AI to write a 500-word article about "The benefits of AI in property management," and the tool would create a coherent article on that theme.
- **Customization to Brand Voice:** The AI can be trained on a client's existing content repository (such as past blog posts or marketing materials) to learn the preferred style and vocabulary. This ensures the generated content aligns with the company's brand voice. If a finance company prefers a very professional tone and specific terminology, the AI will reflect that in its writing.
- **Multilingual Content:** The Content Creator can generate content in multiple languages, which is useful for businesses operating in multilingual markets. For instance, a hotel chain in India and the Gulf might need content in English, Hindi, and Arabic – the AI can produce or translate content into each language while maintaining nuance.
- **Content Types:** It's versatile in the types of content it can handle:
- **Blog posts and Articles:** Complete drafts or outlines on given topics.
- **Social Media Captions and Posts:** Short-form content with a punchy style for platforms like Twitter, LinkedIn, Facebook, etc.
- **Product Descriptions:** E-commerce businesses can auto-generate descriptions for new inventory based on specs.
- **Marketing Copy:** Taglines, advertisement copy, email newsletters, and more.
- **AI-Assisted Editing:** The tool can also improve or rewrite existing content. A user might input a rough draft or bullet points, and the AI will refine it into polished prose. It can ensure proper grammar, clarity, and persuasiveness.
- **Use Case Example:** Suppose a company regularly publishes a monthly newsletter. The marketing team can use the Content Creator to generate the first

draft of the newsletter's articles (e.g. a section on industry trends, a customer success story, etc.). The AI might pull from recent data or provided bullet points to compose each section. The human team then reviews and tweaks as needed. This drastically cuts down the writing time. Another scenario: a small business that cannot hire full-time content writers can rely on the AI to produce weekly blog posts that help with SEO and customer engagement, simply by providing topics or headlines.

By automating content generation, the Content Creator increases productivity and ensures a steady flow of content for marketing and communication needs. It is especially valuable for maintaining active blogs and social feeds without overburdening staff, and ensuring that even technical or large-scale content needs can be met quickly.

Lead Generator

The **Lead Generator** is an AI solution aimed at identifying, collecting, and qualifying leads for businesses. It works to expand a company's customer pipeline by automatically capturing potential customer information and engaging them to assess interest. This product often works hand-in-hand with the AI Sales Person and AI Marketing Manager to feed qualified prospects into the sales funnel.

How the Lead Generator operates:

- **Website Engagement Hooks:** The AI Lead Generator can be integrated into a website as a proactive chat prompt or interactive form. For example, after a visitor spends some time on a pricing page, a chat bubble might appear (driven by the AI) asking, "Would you like a free consultation?" If the visitor says yes, the AI then asks for their name, email, and specific needs – effectively capturing a lead.
- **Interactive Surveys/Quizzes:** The AI can present a short quiz or survey that not only engages the user but gathers useful data. For instance, a financial services company might use a chatbot quiz "Find the right investment plan for you" – the AI asks a series of questions and in the process collects the user's contact and investment preferences. At the end it says, "We have a plan in mind for you. Enter your email to receive your personalized plan," thereby generating a lead with context.
- **Multichannel Lead Capture:** Besides websites, the Lead Generator can operate through social media (via chatbot messages on platforms like Facebook Messenger), via SMS, or through voice calls (in conjunction with the Calling Assistant). It ensures that wherever potential customers interact, there is an opportunity to convert interest into contact information.
- **Lead Qualification:** This AI doesn't just capture raw leads; it also evaluates them. By asking key questions, it can gauge the lead's level of interest or requirements. For example, an AI for a real estate company might ask, "Are you looking to buy or rent?" "What budget range are you considering?" – this information helps categorize the lead (hot, warm, cold, or by requirement type).

The AI can then tag or score the lead in the CRM so sales teams know which leads to prioritize.

- **Integration with AI Sales Person and CRM:** Once leads are captured and qualified, the information is fed into the CRM system and the **AI Sales Person** can follow up with personalized messages. For instance, a lead who showed interest in a particular product might automatically receive an email or chat message the next day (written by AI Marketing Manager, perhaps, and sent by the system) with more info on that product. If the lead responds, the AI Sales Person can continue the conversation. All interactions are tracked for the sales team.
- **Example:** In a *supermarket context*, a Lead Generator might not be as directly used (since it's a retail scenario), but consider an online grocery store: the AI might prompt a new visitor, "Sign up for 10% off your first order!" and gather an email (lead) that way. In a *B2B context*, say export-import, the AI on the company's site might engage business visitors: "Looking for a reliable export partner? Chat with us." Those who engage are asked for their company name and requirements, which creates a sales lead that the human team can follow up on, armed with the info the AI already gathered.

By automating lead generation, businesses ensure they capture interest 24/7 and at scale. The AI Lead Generator reduces the chances of losing potential clients who might slip away without engaging, and it ensures that sales teams have a steady, organized inflow of prospects to work with.

Calling Assistant (AI Calling Assistant)

The **Calling Assistant** is an AI-powered system that can handle voice calls, effectively acting as a virtual phone agent. This assistant can both make outgoing calls and answer incoming calls, engaging in spoken conversation with customers or clients. It's particularly useful for tasks like appointment scheduling, reminders, customer follow-ups, and initial outreach, where a human-like phone interaction is needed but a human agent might not be available for every call. Shivohini TechAI has deployed an AI Calling Assistant in contexts such as the Dubai real-estate market to handle initial property inquiries over the phone.

Key features and operation of the Calling Assistant:

- **Natural Language Phone Conversations:** The AI uses advanced speech recognition to understand what the person on the other end of the line is saying, and it responds with a natural-sounding synthesized voice. It is capable of conversational turn-taking, so the experience is similar to speaking with a human agent. If a customer interrupts or asks a side question, the AI can adapt just as a human would.
- **Inbound Call Handling:** When set to answer incoming calls (for example, a customer support hotline), the Calling Assistant can greet the caller and assist with common requests. For instance, a hotel's reservation line could be handled by the AI after hours: "Hello, thank you for calling XYZ Hotel. How can I assist

you today?” The caller might say they want to book a room, and the AI can walk them through the booking process, answer questions about availability, and even email or SMS a confirmation link.

- **Outbound Calls:** The AI can also initiate calls, which is useful for follow-ups and reminders. A typical use case is **appointment reminders** – e.g., a clinic’s AI calls patients a day before to remind them of their appointment and allows them to confirm or reschedule via voice prompts. Another use case is **sales outreach** – e.g., the AI Calling Assistant calls a list of leads (perhaps gathered by the Lead Generator) to inform them of a new offer. In the real estate scenario, the AI was used to call prospective property buyers, provide details about listings, and ask if they’d like to schedule a tour, all through a phone conversation.
- **Integration with Calendars and CRM:** For scheduling tasks, the AI can integrate with calendar systems. If a customer on the call says, “Yes, I’d like to book a site visit on Tuesday,” the AI can check the calendar for agent availability and schedule the appointment, then send a confirmation to both the client and the human agent. All call results (whether the person was reached, what the outcome was) can be logged in the CRM for record-keeping.
- **Multi-language and Local Dialects:** Because it leverages the same multilingual capabilities as the chat assistant, the Calling Assistant can handle multiple languages and even local dialect/accent variations, which is crucial in markets like India or UAE with diverse language speakers.
- **Escalation to Human:** If the AI encounters a question it cannot answer or a request it isn’t authorized to handle (like a complex complaint), it can gracefully escalate by saying, for example, “Let me connect you to a specialist for that.” It can then forward the call or schedule a callback from a human agent. This ensures that the customer always gets an answer, one way or another.
- **Continuous Learning:** Calls can be recorded and transcribed for analysis. The AI model can learn from these interactions to improve over time – for example, picking up new frequently asked questions and adding them to its knowledge base.

The AI Calling Assistant significantly extends a company’s reach by handling voice communications at scale. It’s like having an always-available call center agent. Businesses benefit by providing immediate responses and engaging customers via the familiar medium of a phone call, but without the need to staff a full call center around the clock.

Advanced Security and Marketing System (for Retail Environments)

Shivohini offers an integrated **Advanced Security and Marketing System** tailored for physical establishments such as showrooms, retail stores, hotels, offices, and supermarkets. This solution combines AI-driven security features with marketing analytics to not only protect premises but also enhance customer insights and experiences in those spaces.

Components and functionality of this system include:

- **AI Surveillance & Security:** High-grade cameras and sensors monitored by AI algorithms form the backbone of security. The system can perform real-time video analytics to detect security threats or unusual activities. For example, it can automatically detect if someone is loitering in a restricted area or if a store shelf is being tampered with after hours, and immediately alert security personnel. In a hotel scenario, the AI might monitor CCTV feeds to detect if an unauthorized person enters a secure area (like a staff-only zone) and send an instant notification.
- **Face Recognition System:** A built-in **Face Recognition System** (one of Shivohini's specialized technologies) is used to identify individuals on camera. In a retail or showroom context, this can serve multiple purposes:
 - **Security:** Recognize blacklisted individuals or known shoplifters as they enter, and quietly alert security staff.
 - **VIP Customer Recognition:** On the marketing side, recognize loyal or important customers when they walk in (provided they've consented and are enrolled in a VIP program). For example, a car showroom could greet a returning customer by name and immediately notify a sales rep on the floor about their arrival along with notes of their preferences.
 - **Customer Footfall Analytics:** The system tracks movement patterns of people within the store or showroom. AI can generate heat maps of where customers spend most of their time, how they navigate aisles, and which displays attract the most attention. This information is invaluable for marketing and layout optimization. For instance, a supermarket can learn which sections are most visited during certain hours and adjust product placements or staffing accordingly.
 - **Targeted Advertising & In-Store Marketing:** The "marketing" aspect comes from tying the analytics to active customer engagement:
 - **Digital Signage Integration:** The system can control digital signage or interactive screens. Using demographic recognition (age group, gender) or recognizing a VIP customer, it can change the advertisement being displayed. E.g., if the camera detects a young adult male, the nearby screen might show a promotion for sports apparel; if it's a family, maybe a promotion for kids' products.
 - **Smart Announcements:** In a shopping mall or large store, the AI could trigger specific audio announcements when certain conditions are met (like a reminder to visit a new section if foot traffic there is low).
 - **Automated Access Control:** In office or hotel applications, the face recognition can be used for access control – doors or turnstiles open for authorized personnel or guests automatically. This doubles as both security and convenience (key-card free entry).
 - **Data Dashboard:** Managers have access to a dashboard that summarizes both security events and marketing data. For security, it logs incidents (e.g., "motion detected at northwest exit at 2 AM"). For marketing, it provides stats like daily visitor counts, repeat vs new visitors (if face recognition is used for loyalty

tracking), peak times, and conversion metrics if applicable (e.g., how many people who entered a showroom ended up at the sales desk).

- **Use Case Example:** Consider a **supermarket** deploying this system. The AI cameras at entrances and aisles track how many customers enter and which sections they visit. One insight might be that a lot of customers go to the electronics section but few purchase items there. The marketing team uses this data to rearrange the section or run a promotion. Meanwhile, on the security side, the system after hours detects an individual in an employees-only stockroom; it automatically sounds an alarm and alerts the store manager's phone. During store hours, a known repeat customer is recognized at the entrance; the system could send a message to the customer's phone via the store's app: "Welcome back! Here's a coupon for you, valid today only." This marries security surveillance with a personalized customer touch.

In summary, the Advanced Security and Marketing System leverages AI to provide a *smart environment* in retail and hospitality venues – safeguarding assets and at the same time gathering intelligence that can drive sales and improve customer service. It's an example of the convergence of security technology with business marketing needs.

Advanced Security Systems for Homes (Villas & Apartments)

For high-end residential settings like luxurious villas and apartments, Shivohini TechAI offers **Advanced Security Systems** that incorporate AI for enhanced safety, automation, and convenience. These smart home security solutions are designed to protect homeowners while also providing automation (the "smart home" aspect) to make daily living more comfortable and efficient.

Key features of the residential Advanced Security System include:

- **AI-Powered Surveillance:** Similar to the retail system, the home solution uses cameras and sensors with AI to detect unusual events (e.g., an unknown person at the door, a window break, or movement in the house while owners are away). The AI can distinguish between routine occurrences and potential intrusions, reducing false alarms. For instance, it can tell a pet moving around apart from a human intruder.
- **Facial Recognition Entry:** The system can employ facial recognition at entry points (front door, gate) to identify residents and approved visitors. Doors can automatically unlock for recognized faces (household members or say a regular housekeeper), while unrecognized visitors prompt an alert. The homeowner could receive a notification with the visitor's image on their phone, and remotely grant entry or engage in two-way communication via an AI-assisted intercom (where the AI might greet the visitor if the owner is not immediately available).
- **Smart Home Automation:** The security system is integrated with home automation features (this covers the "smart home automation" solution that Shivohini provides). This means in addition to security, the system can control lighting, climate, and appliances:

- **Presence Simulation:** If the house is empty, the system can turn lights on/off or even open curtains at scheduled times to simulate occupancy, deterring burglars.
- **Environmental Controls:** The AI learns the residents' routines and can adjust air conditioning or heating and lights automatically. It could, for example, turn on pathway lights and AC when it recognizes the homeowner arriving, creating a comfortable welcome.
- **Voice-Controlled Home Assistant:** Residents can interact with the home system via voice commands (through a mobile app or smart speaker). For example, saying "Assistant, secure the house for night" could lock all doors, arm the security alarms, turn off downstairs lights, and adjust the thermostat – a comprehensive routine done intelligently.
- **Emergency Detection and Response:** The system can include AI smoke detectors, gas leak detectors, or other hazard sensors. If an alarm triggers (say smoke detected in the kitchen), the AI can cross-verify through cameras (e.g., seeing actual fire or smoke) and immediately alert the homeowners and emergency services. It can even attempt to mitigate issues, like activating a fire suppression system if available.
- **Remote Monitoring:** Homeowners can check their home status in real-time via a smartphone app. Live camera feeds, alert history, and the ability to speak through the system (for example, to anyone at the door) are provided. The AI can also send daily summaries or instant alerts – e.g., "No security events detected today, all is well" or "ALERT: Movement detected in backyard at 2:00 AM, view camera feed now."
- **Security + Convenience Integration:** A notable aspect is how security features double as conveniences. For example, the face recognition not only keeps intruders out but also removes the need for keys for family members. The same cameras that secure the perimeter can also let the AI identify that the children have arrived home from school (recognizing their faces at the gate) and then trigger an alert to the parents like "Children are home safely at 3:45 PM." This blend of home security with lifestyle convenience is a big selling point.
- **Privacy and Control:** Given this is a home setting, the system is designed with privacy in mind. Homeowners have full control on which AI features to enable. Data (like camera footage or face data) is stored securely and mostly processed locally to alleviate privacy concerns.

In essence, the Advanced Security System for Villas/Apartments is a comprehensive smart home solution focused on safety. It uses AI to not just react to problems, but to anticipate and prevent them (through deterrence and early detection), while making everyday life smoother via automation. It's suitable for high-end residences where owners want peace of mind and the luxury of a smart, responsive home environment.

Interactive Website (Voice-Navigable Website)

The **Interactive Website** solution is a unique offering by Shivohini TechAI that transforms a standard business website into a voice-navigable, interactive experience. This is achieved by integrating the AI Virtual Assistant and voice recognition into the

website, allowing users to browse and control the site through voice commands in addition to (or instead of) traditional clicking and typing. The goal is to provide a *Voice-First User Experience* on the web, improving accessibility and user engagement.

Key capabilities of the Interactive Website include:

- **Anywhere, Any Device Accessibility:** The voice-interactive features are designed to work across desktop computers, tablets, and mobile devices seamlessly. Regardless of the device, users can speak commands to navigate. There's no need for special apps – it works within standard web browsers (Chrome, Firefox, Safari, etc.) and is optimized to be lightweight so that even mobile users get a smooth experience.
- **100% Click-Free Navigation:** Users can perform all typical website navigation through voice. For example, instead of scrolling and clicking menus, a user could say, "Go to the Contact Us section," and the site will automatically scroll or jump to that section. Commands like "Open the Products page," "Play the introduction video," or "Show me the pricing details" are understood by the AI and translated into the appropriate page actions. This means a user with their hands full or someone who prefers voice interaction can browse effortlessly.
- **Natural Language Commands:** The system isn't limited to strict commands; thanks to NLU, it can handle more complex utterances. A user might say, "I'm interested in what services you offer for hotels," and the AI could respond by highlighting or directing to the section of the site about hotel industry solutions. The site essentially has a conversational layer on top of its content.
- **Voice-First Design Elements:** To complement voice interaction, the website provides visual feedback for spoken commands. For instance, if a user says "Show FAQs," the section might glow or an outline might flash around it as it scrolls into view, confirming to the user that the command was received and executed. Additionally, content can be read aloud: if a user says "Read this page," the AI will use text-to-speech to narrate the content of the page, which is great for visually impaired users or those who prefer listening.
- **Integrated Virtual Assistant:** At any point, the user can ask the AI Virtual Assistant embedded on the site questions in natural language. For example, "What does Shivohini TechAI do?" or "How can I request a demo?" The assistant will either navigate to the relevant page or display an answer directly, pulling from the website's information. This is akin to a guided tour of the site via Q&A.
- **Accessible & Inclusive:** One of the driving motives for the Interactive Website is accessibility. Voice navigation allows people with limited mobility (who might find using a mouse or keyboard difficult) to use the site effectively. The built-in text-to-speech reading of content aids users with visual impairments by reading out site information. By saying something like "Read the latest news article," a blind user could listen to content without a screen reader, since the site itself offers the functionality.
- **Multi-Language Support in Voice:** If the site caters to a multilingual audience, the voice commands and content can be in multiple languages. A user could speak in Hindi or Arabic, and the site (via the AI) will understand and respond in

that language, including reading content in that language. This ties into the AI's multilingual capabilities and makes the website welcoming to non-English speakers, truly allowing them to interact naturally.

Example scenario: A potential client visits Shivohini TechAI's own website. Instead of clicking through menus, they click the microphone icon (or if configured, just start speaking). They say, *"Tell me about your AI Sales Person product."* The website's AI then possibly speaks out a brief description and simultaneously navigates the user to the AI Sales Person section on the products page, highlighting it. The user then says, *"Scroll down a bit,"* the site smoothly scrolls. The user might follow up with, *"Play the customer testimonial video,"* and the site plays it. Finally, the user says *"Contact you,"* and the AI opens the contact form or provides the contact info, even offering *"Would you like me to fill your name and email from your account?"* if the user is logged in. This kind of interactive browsing makes the experience engaging and efficient.

In summary, the Interactive Website offering brings voice interactivity and AI guidance into web browsing. It's especially beneficial for businesses that want to stand out with cutting-edge user experience or need to ensure their web content is accessible to all users. It also aligns with the global trend of voice-first computing, where more people are using voice assistants – here the website itself behaves like one.

Face Recognition System

The **Face Recognition System** is a specialized AI solution by Shivohini TechAI focused on identifying or verifying people's identities from images or video (typically from camera feeds). While we've touched on its use as a component in security systems, it can be considered a standalone product for clients who need advanced facial recognition capabilities for various purposes.

Key aspects of Shivohini's Face Recognition System include:

- **High-Accuracy Identification:** The system uses machine learning models trained on facial data to recognize individuals with a high degree of accuracy. It can match a person's face against a database of known faces (for example, employees, registered customers, or security watch-lists) in real-time. The identification process accounts for variations in lighting, angles, facial expressions, and even partial occlusions (such as glasses or masks to some extent).
- **Access Control and Attendance:** For corporate or institutional clients, this system can be used for **access control**, replacing or augmenting keycards and PINs. A camera at a door can automatically unlock it if the face is recognized as an authorized person. Likewise, in workplaces or schools, it can serve as a touchless attendance system – logging when employees or students arrive and leave by recognizing their faces, thereby eliminating the need for biometric fingerprint scanners or ID swipes.
- **Security Monitoring:** As part of a surveillance setup, the Face Recognition System can continuously scan faces in camera footage and compare against specific lists:

- **VIP List:** e.g., in a hotel lobby, recognizing a VIP guest on sight so staff can be alerted to provide personalized service.
- **Black-list:** e.g., a retail chain can maintain a list of known shoplifters; if one enters any branch, the system flags it.
- **Stranger Alert in Secure Zones:** In an office, if someone not recognized as staff enters a sensitive area, an alert is triggered.
- **Event Personalization:** At events or exhibitions, the system could be used for registration and personalization. Attendees could walk up to a kiosk that recognizes them (if they've opted in and uploaded a photo during registration) and automatically prints their badge or directs them to sessions of interest. It speeds up check-ins and creates a high-tech impression.
- **Privacy and Data Security:** Recognizing the sensitivity of facial data, Shivohini's system is typically deployed with strong encryption and compliance to privacy laws. If used in public-facing contexts, it's generally configured to either require opt-in (e.g., only recognizing faces of those who enrolled) or to anonymize data unless there's a match to a specific list. The system might, for example, immediately discard facial data that doesn't match anyone in the database, rather than storing it.
- **Integration Capabilities:** The Face Recognition System can integrate with other systems like HR databases (to sync employee photos), CRMs (customer images for VIP programs), or security alarm systems (to trigger an alarm or lock doors on certain recognitions). It provides an API or middleware that allows it to be plugged into third-party applications.
- **Real-Time and Batch Modes:** In real-time mode, it processes video streams live (e.g., CCTV feed analysis). In batch mode, it can scan through recorded footage or a set of images to find persons of interest. This could be used for forensic analysis (e.g., searching days of security footage for appearances of a particular person).
- **Use Case Example:** A mid-sized tech company implements Shivohini's face recognition at its entrance. Employees no longer need to carry RFID badges; a camera at the door recognizes them and unlocks the door, logging their entry time. If an unknown person tries to tailgate (follow an employee in), the system detects an unrecognized face and pings security or reception to check. Separately, the HR department uses the logged data to generate attendance reports. In another scenario, a retail store chain integrates the system with their loyalty program: customers who volunteer a photo as part of their profile can get a personalized greeting via a screen or sales associate when they enter, because the system identified them, perhaps even pulling up their past purchases so staff can assist better. These scenarios improve security and/or customer experience through the power of facial recognition.

In all, the Face Recognition System provides the critical AI capability of recognizing individuals, which can be applied to enhance security, streamline operations (through automation of ID checks), and create personalized experiences. Shivohini TechAI packages this technology in a way that clients can deploy within their environment,

adjusting settings for accuracy vs. speed, and ensuring it aligns with their privacy policies.

Customized Drone Solutions

Shivohini TechAI's **Customized Drone** solutions involve providing clients with drones that are equipped with AI capabilities for specialized tasks. Drones (unmanned aerial vehicles) can be incredibly useful in various industries, and by integrating AI, Shivohini tailors them to perform intelligent, autonomous operations rather than just remote-controlled flight. This product line is bespoke by nature: it starts with understanding a specific use-case and then developing a drone system (hardware + AI software) to meet those needs.

Possible features and operations of Customized Drone solutions include:

- **AI-Powered Vision:** Drones can be fitted with cameras and AI vision systems to detect and analyze visual information from the sky. For example, in agriculture, a drone could survey crops and use AI to identify areas affected by pests or needing water. In construction or real estate, a drone could inspect buildings or land, identifying cracks or structural issues via image analysis.
- **Autonomous Navigation:** The drones are programmed to navigate routes or areas without constant human control. AI algorithms (potentially with GPS, Lidar, etc.) allow the drone to avoid obstacles (like trees, buildings, birds) and follow a set patrol or survey pattern. For instance, a security drone might autonomously patrol a perimeter fence line at scheduled intervals, using AI to keep altitude and distance consistent and to deviate around new obstacles.
- **Specific Task Modules:** Depending on the project, drones can have additional modules:
- **Surveillance & Security:** Loudspeakers to issue warnings, thermal cameras to detect heat signatures at night (for finding intruders), and integration with the security system so that if an alarm is triggered, a drone can be dispatched automatically to the location to provide a live feed.
- **Delivery Drones:** If the task is delivery, AI helps plan optimal routes and handle package handling. For example, a customized drone might deliver small items (medicine, documents) across a campus or to remote locations, using AI to drop the item safely at the correct spot.
- **Industrial Inspection:** Drones for inspecting infrastructure (like cell towers, wind turbines, solar panels) using high-resolution cameras and possibly ultrasonic or other sensors. AI can analyze the collected data to spot anomalies (e.g., a crack in a turbine blade or a hotspot on a solar panel) and report back with those findings.
- **Real-Time Data Streaming and AI Analysis:** What sets these custom drones apart is that the data they gather (video, images, sensor readings) can be processed on-board or immediately upon streaming to detect issues or targets. This reduces the need for a human to sift through footage later – the AI can flag points of interest in real time. For instance, a drone surveying a crowd (for

security at an event) could have AI to detect if someone falls down or if there's an unattended bag, alerting security immediately.

- **Ease of Control:** While largely autonomous, these drones typically come with a control interface for operators to supervise and intervene if needed. Shivohini might provide a tablet-based control app showing the drone's live feed, telemetry, and allowing one-touch commands like "Return to base" or "Hold position". The AI's autonomy significantly reduces the piloting skill required – the operator can be more of a supervisor than an expert pilot.
- **Use Case Example:** Consider a **logistics warehouse** scenario. Shivohini delivers a customized inventory drone that does nightly inventory scans. The drone flies through the warehouse aisles after hours with an attached camera and RFID scanner. AI enables it to navigate safely indoors, avoid obstacles like shelving, and scan inventory tags. It compares the scanned inventory with the database and flags discrepancies (e.g., items that are misplaced or missing). By morning, the warehouse manager receives a report generated by the drone's AI: "Aisle 3, Section B: 2 units of Product X missing (expected 10, found 8)." This task would have been labor-intensive for humans but is done automatically by the drone each night. In another deployment, a **construction company** uses a drone to monitor progress on a building site. The AI stitches aerial images to create a 3D model daily, comparing it to project plans to see if construction is on schedule. Any deviations or potential issues (like an area where work hasn't progressed in a while) are highlighted for managers.

Shivohini's Customized Drone solutions exemplify the fusion of hardware and AI. By customizing drones for specific industries – be it security patrols, deliveries, inspections, or surveys – they provide clients with cutting-edge tools that can operate in the physical world intelligently. Each drone project is highly tailored, ensuring that the drone's design and AI capabilities align perfectly with the problem at hand.

Industry-Specific AI Applications

Shivohini TechAI adapts its AI Agent platform and product suite to various industries, providing specialized solutions for each domain. Below, we detail how Shivohini's AI is applied in each of the industries they serve, along with sample use case flows and example chatbot dialogues illustrating interactions for different personas (customers, owners/managers, employees).

Hotel Industry

AI Solutions in Hotels: In the hospitality sector, Shivohini's AI acts as a digital concierge, marketing analyst, and guest engagement tool. Key applications include:

- **Review Summarization:** The AI agent automatically collects guest reviews (from feedback forms, online review sites, etc.) and generates concise summaries of guest sentiment. This helps hotel management quickly grasp common praises or issues without reading every review.

- **Loyalty Outreach:** The system identifies returning guests or loyalty program members and sends them targeted offers or personalized promotions, improving customer retention. For example, a repeat guest might receive an email or WhatsApp message offering a special rate for their next stay.
- **Customer Analytics:** AI analytics dashboards visualize guest data (occupancy trends, guest preferences, popular amenities usage) to reveal patterns. Management can see, for instance, which demographics frequent the hotel most and tailor services accordingly.

Example Use Case: Guest Feedback to Loyalty Outreach Flow

1. **Collect Feedback:** After check-out, guests receive an automated survey via the AI Virtual Assistant (through email or app). A guest fills out the survey and writes a review of their stay.
2. **AI Review Analysis:** The AI agent aggregates this new review with others and **summarizes feedback**. It might note, for instance, that “many guests loved the breakfast buffet but mentioned slow check-in process”.
3. **Management Alert:** The summarized insights are sent to hotel management in a weekly report. Noticing the check-in issue, managers adjust staffing or procedures.
4. **Loyalty Identification:** The AI cross-checks if the reviewer is a returning guest or loyalty member. If yes (say the guest has stayed 3 times before), it flags them as a valuable returning customer.
5. **Personalized Offer Creation:** The AI Marketing Manager component automatically drafts a *loyalty outreach* message for that guest. E.g., “Thank you for your feedback! As a valued guest, enjoy 20% off on your next stay with promo code WELCOME20.”
6. **Outreach:** The AI sends this offer via the guest’s preferred channel (email or text). It also logs the offer in the CRM under that guest’s profile.
7. **Follow-Up Interaction:** When the guest returns to the hotel website or booking engine, the AI Virtual Assistant will recognize them (via login or cookie) and can remind them of the special offer: “Welcome back! Ready to use your 20% off for your next stay?” thus smoothly integrating marketing with the user’s booking flow.

This flow shows how guest feedback not only improves operations but is looped back into marketing to drive repeat business, all handled by the AI autonomously.

Sample Chatbot Conversations

Conversation 1: Hotel Guest and AI Concierge (Customer Support)

Guest: Hi, I'd like to book a room for tomorrow night. Do you have any availability?

AI Concierge: Hello! Sure, I can help with that. Let me check. For tomorrow night, we have Deluxe and Suite rooms available. How many guests will be staying?

Guest: Just me, for one night.

AI Concierge: Got it. A Deluxe room for one night is available at ₹5000. Would you like to reserve that?

Guest: Yes, please.

AI Concierge: Great. I've booked a Deluxe room for you on Nov 16, 2025. You'll

receive a confirmation via email shortly. **By the way, I see you've stayed with us before** – welcome back! As a returning guest, I've applied a 10% loyalty discount. Your final price is ₹4500. Is there anything else I can assist with, like airport pickup or any special requests?

Guest: Wow, thank you! Can I get an airport pickup?

AI Concierge: Certainly. I have scheduled an airport pickup for you. A hotel car will meet you at the arrivals area. We look forward to seeing you tomorrow, and have a great day!

(In this dialogue, the AI recognized a returning guest and automatically applied a loyalty discount, demonstrating personalized service.)

Conversation 2: Hotel Manager and AI Analytics Assistant (Internal Use)

Manager (Owner Persona): Hello AI, I need an overview of how the hotel has been performing this week.

AI Assistant: Good afternoon! Here is this week's performance summary: Average occupancy was 85%, up 5% from last week. Guest satisfaction scores averaged 4.2/5. We received 32 new guest reviews. Common feedback: guests loved the renovated spa, and a few mentioned improving Wi-Fi speed.

Manager: Show me more about the Wi-Fi feedback.

AI Assistant: Sure. Out of 32 reviews, 5 mentioned Wi-Fi. Three guests in rooms on higher floors reported slow internet speeds in the evenings. I recommend checking the router on those floors.

Manager: Noted. How about revenue – what was our revenue this week?

AI Assistant: This week's total revenue was ₹12,00,000. Room bookings contributed ₹9,50,000 and the rest came from services (spa, dining, etc.). It's a 8% increase over last week, partly due to the festival season influx.

Manager: Great. Can you email me this report and also schedule a meeting with the front desk team about check-in improvements?

AI Assistant: Absolutely. I've emailed the detailed weekly report to you and other executives. I have also scheduled a meeting for Monday at 10 AM with the front desk team regarding check-in process improvements (I included the issue about peak-time delays derived from recent feedback). Anything else I can help you with?

Manager: That's all for now, thanks.

(This conversation illustrates the AI assisting a hotel manager by providing analytics and handling tasks like sending reports and scheduling meetings.)

Conversation 3: Hotel Staff and AI Assistant (Employee Persona)

Front Desk Staff: AI, a guest just asked if we can provide a late checkout tomorrow. Can you check their profile for eligibility?

AI Assistant: Checking guest profile... The guest in Room 402 is a Gold-tier loyalty member. Gold members are entitled to complimentary late checkout up to 3 hours.

Front Desk Staff: That's good. Have we applied that before for them?

AI Assistant: Yes, on their last stay in September, they requested late checkout and it was granted till 3 PM with no charge.

Front Desk Staff: Perfect. Please note on their record that late checkout till 3 PM is approved for tomorrow. Also, can you inform housekeeping about it?

AI Assistant: Done. I've updated the guest's reservation with late checkout at 3 PM

and notified housekeeping to adjust their cleaning schedule.

Front Desk Staff: Great. One more thing, could you quickly tell me if Room 510's minibar charges are recorded? I need to prepare their bill.

AI Assistant: Room 510's minibar usage: 2 sodas and 1 snack, total ₹500, have been recorded and added to their bill. Their final bill amount currently is ₹8,000.

Front Desk Staff: Thank you. That helps a lot.

(This dialogue shows the AI helping internal staff by retrieving guest info and updating records in real time, acting like an always-available colleague who has all the data.)

Restaurant Industry

AI Solutions in Restaurants: In the restaurant and food service industry, Shivohini's AI plays the role of a virtual waiter, customer engagement tool, and operations assistant. Key features include:

- **24/7 Virtual Waiter:** An AI chatbot (text or voice) handles customer orders and inquiries. It can take detailed food orders, assist with menu navigation, manage table reservations, and recommend best-seller dishes. This is available to customers via the restaurant's website, mobile app, or even at a kiosk/tablet on-site.
- **Seamless Billing & Feedback:** The AI streamlines the payment and feedback process. It can send digital bills via WhatsApp or SMS, integrate with payment gateways for quick online payment, and after dining, prompt customers to fill a feedback form or review. This reduces wait times for bills and ensures feedback is captured in real-time.
- **Customer Insights & Marketing:** The system collects data on customer orders and preferences. Using that, it performs trend analysis (e.g., most popular dishes, peak dining times) and can send personalized offers to customers – such as a discount on a frequently ordered item or a coupon for their birthday.

Example Use Case: AI Virtual Waiter Ordering Process

1. **Greeting & Menu Browsing:** A customer opens the restaurant's mobile app at noon to order lunch for pickup. The AI Virtual Waiter greets: "Hi, welcome to Foodie's Hub! What are you in the mood for today?" The customer can either type or use voice. They say they'd like to see the **best-sellers**. The AI then presents the digital menu highlighting top-selling items and also says, "Our chef's specials today are Grilled Paneer Tikka and Butter Garlic Noodles."
2. **Order Taking:** The customer decides to order via voice: "I'll have one grilled paneer tikka and two butter garlic noodles." The AI confirms the order details, perhaps even suggesting, "Would you like any drinks or desserts with that?" If the customer adds a drink, the AI updates the order.
3. **Customization:** The customer has a special request: "Make the noodles less spicy, please." The AI acknowledges and adds a note to the order for the kitchen: "prepare with mild spice" – reflecting the customer's preference.
4. **Order Summary & Payment:** Once the order is complete, the AI shows an order summary with prices and asks the customer to confirm. After confirmation, it offers payment options. The customer chooses to pay online. The AI then

processes the payment through an integrated gateway and confirms: “Your payment was successful. Your order will be ready for pickup in 20 minutes.”

5. **Order Notification:** The kitchen receives the order instantly through the restaurant’s system. The AI Virtual Waiter also notifies the staff: “New pickup order #1234: Grilled Paneer Tikka x1 (for 1 person), Butter Garlic Noodles x2 (mild spice), + drink. Due by 12:20 PM.”
6. **Pickup Coordination:** When the food is nearly ready, the AI sends the customer a WhatsApp message or app notification: “Your order is almost ready! You can pick it up in 5 minutes. If you need directions to our restaurant, just let me know.” The customer can even respond to the bot if needed (“I’m running late”, etc., and the AI can relay that info to staff).
7. **Feedback Collection:** After pickup, the AI later messages: “Hope you enjoyed your meal! Could you rate your experience or any dish feedback?” The customer gives a quick rating in chat. The AI thanks them and perhaps says, “Thanks! Next time, try our new dessert – we’ve added a 10% off coupon for you.”

This use case shows how the AI handles an entire order lifecycle, improving customer convenience and capturing useful data (preferences, feedback) for the restaurant.

Sample Chatbot Conversations

Conversation 1: Customer and AI Virtual Waiter (Placing an Order)

Customer: Hi, I’d like to reserve a table for dinner tonight.

AI Waiter: Hello! Sure, for how many people?

Customer: It’s for 4 people at 7 PM.

AI Waiter: Got it. A table for 4 at 7:00 PM tonight is available. I’ve reserved that under your name. Anything else I can help with? For example, I can take any advance food orders or note special requests.

Customer: Actually, can you tell me your popular vegetarian dishes?

AI Waiter: Certainly. Our best-selling vegetarian dishes are the Paneer Butter Masala and the Grilled Veggie Platter. We also have a new vegan Thai curry that’s quite popular.

Customer: Sounds good. Can you note that one of our guests has a peanut allergy?

AI Waiter: I’ve added a note: *One guest has a peanut allergy – ensure no peanuts or peanut oil.* Our kitchen will be informed. Is there anything else you’d like to do?

Customer: No, that’s all. Thank you!

AI Waiter: You’re welcome! Your table is confirmed. We look forward to serving you. (You’ll receive a confirmation message.) Feel free to chat with me if you need anything else.

(The AI seamlessly handled a reservation and captured a special dietary note to pass to staff.)

Conversation 2: In-Restaurant Digital Assistant (Dine-in Scenario)

At the restaurant table, an interactive menu tablet is available.

Customer: *[taps Voice]* “Could we get another bottle of water and one extra plate?”

AI Tablet Assistant: *[Displaying]* Additional water and plate request. *[Speaking]* “Certainly! I’ve alerted a waiter to bring a water bottle and an extra plate right away.”

(A waiter confirms delivery shortly.)

Customer: *[via Voice]* “Now, I’d like to order dessert. What do you recommend?”

AI Tablet Assistant: “Our signature dessert is the Chocolate Lava Cake. Would you like to try that? It’s one of our top-rated items.”

Customer: “Sounds great. One lava cake, please.”

AI Tablet Assistant: “Excellent choice. I’ve placed the order for 1 Chocolate Lava Cake. It will be out shortly. Enjoy!”

(After dessert is served and eaten.)

AI Tablet Assistant: “I see you’ve finished your meal. Whenever you’re ready, I can assist with the bill. Just say ‘Checkout’ or press the bill icon.”

Customer: “Checkout.”

AI Tablet Assistant: “Your total is ₹2,300. Would you like to pay by card, cash, or UPI?”

Customer: “UPI.”

AI Tablet Assistant: “Please scan this QR code to pay.” *[Displays QR code]*. “Once payment is done, I’ll send the receipt to your WhatsApp.”

(Customer scans and pays.)

AI Tablet Assistant: “Payment received. Thank you! We’ve sent your digital receipt and a feedback link. Have a great evening!”

(This illustrates an AI assisting with on-site service: it communicates with staff and handles orders/billing without the customer waiting for a human server for every need.)

Conversation 3: Restaurant Owner and AI Dashboard (Internal Query)

Owner: Hi, AI. How did our new vegan dish perform this week?

AI Assistant: Hello! The new vegan Thai curry was ordered 25 times this week. That’s a 20% increase from last week. It’s our 4th most popular entree among vegetarian options now.

Owner: That’s good. What’s the feedback on it?

AI Assistant: From customer feedback forms, the vegan Thai curry received an average rating of 4.5/5. Positive comments mention great flavor. One suggestion was to offer a choice of spice levels.

Owner: Noted. Also, how are online orders versus dine-in sales lately?

AI Assistant: Online orders accounted for 40% of total sales this week, and dine-in 60%. Online ordering has grown 10% month-over-month, likely due to our social media promotion last week.

Owner: Great. One more thing – did we get more reservations after we launched that new weekend brunch?

AI Assistant: Yes, we did. This upcoming weekend is 90% booked for brunch slots, compared to 50% on typical weekends. The new “Sunday Jazz Brunch” promotion seems to be effective.

Owner: That’s great. Please remind the kitchen to prepare for roughly 90 guests on Sunday morning.

AI Assistant: I’ve sent a note to the kitchen team’s group chat to expect ~90 brunch guests and ensure sufficient ingredients/staffing. Anything else?

Owner: That’s all, thanks.

(This conversation shows an owner checking in on business metrics and the AI providing actionable data, even taking initiative to inform the team about a busy event.)

Supermarket Industry

AI Solutions in Supermarkets: In the retail supermarket context, Shivohini's AI functions as a smart shopping assistant and a behind-the-scenes data analyzer. Key applications include:

- **Product Locator:** An in-store AI assistant (accessible via a kiosk, mobile app, or chatbot) helps customers quickly find items on the shelves. Instead of wandering aisles, a shopper can ask "Where can I find olive oil?" and the AI will respond with the aisle number or even a store map highlighting the location.
- **Review Insights:** The AI system gathers customer feedback (from surveys, online reviews of the store, etc.) and summarizes it to provide actionable insights. For example, if multiple shoppers mention that checkout lines are slow on weekends, management will be alerted to open more counters.
- **Personalized Marketing:** Based on purchase history and loyalty card data, the AI sends tailored promotions to customers. Shoppers might receive coupons that match their buying habits (e.g., a discount on a brand they frequently buy, or suggestions for products related to past purchases).

Example Use Case: In-Store Shopping Assistant Flow

1. **Kiosk Query:** A shopper enters the supermarket looking for a specific item, say "gluten-free pasta". They approach an AI-powered touch-screen kiosk at the store entrance or use the store's app on their phone. They type or ask, "Gluten-free pasta?".
2. **Product Locator Response:** The AI searches the store's inventory and replies: "Gluten-free pasta is in Aisle 5, Organic Foods section, middle shelf." It might display a simple map of Aisle 5 pinpointing the section. If the store is large, it could even indicate a route or say "Take the second aisle to your right."
3. **Alternate Suggestion:** If that product is out of stock (the AI is aware of real-time inventory), it might add: "Note: our usual brand is out of stock, but we have gluten-free rice noodles in Aisle 5 as an alternative." This ensures the customer doesn't hit a dead end.
4. **Upsell via Personalization:** The AI knows the shopper's loyalty card and purchase history (assuming they logged in on the app or scanned their card at the kiosk). Suppose this shopper often buys a certain tomato sauce. The AI could proactively say, "There's a 10% off on Marinara Sauce today, which goes great with pasta. It's in Aisle 3 if you're interested." This leverages **personalized marketing** on the spot.
5. **Shopping List Integration:** The customer can also ask something like, "Find all items on my list." If they have a digital shopping list in the app, the AI will map out where each item is and perhaps optimize a path through the store (e.g., "Start at Produce for apples (Aisle 1), then Bread (Aisle 2), then Dairy for milk (Aisle 8)...").
6. **Real-Time Assistance:** While shopping, if the customer uses a smartphone assistant, they can ask additional questions: "Do you have any almond milk in

stock?" The AI can check inventory and respond, "Yes, Almond Fresh brand is available in the Dairy section, Aisle 8, top shelf. 5 units left."

7. **Feedback Prompt:** After checkout, if the customer has the app, they might get a ping: "Did you find everything you were looking for today?" If they respond with something like "I couldn't find whole grain bread," the AI flags that and could inform management or update the product locator if it was an error.
8. **Analytics for Manager:** Separately, the system logs common queries. It might show that dozens of people searched for "gluten-free" items weekly. The store manager gets a report that "Gluten-free products are in high demand; consider expanding that section or better signage." This is an example of how **review insights** and query analytics inform store strategy.

Sample Chatbot Conversations

Conversation 1: Shopper and AI Store Assistant (Customer Persona via Mobile App)

Shopper: (On the app) Where can I find organic honey?

AI Assistant: Organic honey is in Aisle 4, in the Organic Foods section, middle shelf. You'll see it near organic jams.

Shopper: Thanks. Also, is there any sale on rice?

AI Assistant: Yes, we have a sale on several rice brands. For example, IndiaGate Basmati is 15% off today. The rice section is Aisle 7. Would you like me to add a coupon for IndiaGate rice to your account?

Shopper: Sure, that's my preferred brand.

AI Assistant: Done. A 15% off coupon for IndiaGate Basmati has been added. It will apply at checkout. Anything else I can help you find?

Shopper: No, I'm good.

AI Assistant: Happy shopping! If you need anything, just ask. And don't forget to use your loyalty card at checkout to apply your discounts.

(The AI guided the customer and even did on-the-fly marketing by offering a relevant coupon.)

Conversation 2: Customer and AI Self-Checkout Assistant

(Customer at a self-checkout machine encounters an issue.)

Customer: (speaking to the kiosk) I need help, it's not scanning this item.

AI Kiosk: Apologies for the inconvenience. Which item are you trying to scan?

Customer: This bag of apples.

AI Kiosk: Let me check. *[Uses camera]* I see you have an organic apple bag. Those sometimes need a produce code. The code for organic apples is 4017. I've entered it for you – 2 kg at ₹150. Is that correct?

Customer: Yes. Thanks.

AI Kiosk: Great. I've added the apples to your bill. Your current total is ₹940. Do you want any bags?

Customer: Yes, one bag.

AI Kiosk: Added one reusable bag for ₹10. Your new total is ₹950. You can pay by card or UPI.

Customer: (swipes card)

AI Kiosk: Payment received. Here's your e-receipt. Thank you for shopping with us! By

the way, you saved ₹120 today using 3 coupons. Have a great day!
(The AI at self-checkout recognized the item via camera and helped complete the purchase without human intervention, also giving a summary of savings which is a nice customer touch.)

Conversation 3: Store Manager and AI Analytics (Internal Persona)

Manager: AI, what were the top 5 customer inquiries this week?

AI System: The top inquiries at the Product Locator kiosks/app this week were: 1) Gluten-free products (e.g., bread, pasta) – 50+ queries, 2) Baking supplies (flour, sugar) – 30 queries, 3) Dairy-free milk – 25 queries, 4) Location of spices aisle – 20 queries, 5) Organic produce availability – 18 queries.

Manager: Interesting. Are we running low on any of those items commonly asked for?

AI System: We are adequately stocked on most. However, gluten-free pasta is nearly sold out (90% of stock depleted). Dairy-free almond milk is at 20% stock (might run out before next delivery).

Manager: I'll order more of those immediately. What about customer feedback? Any common themes?

AI System: Customer feedback forms highlight that checkout speed improved after opening the new counter. There's one complaint trending: the parking lot lighting is dim at night.

Manager: Noted, I'll get that fixed. Also, how effective were last week's personalized coupons?

AI System: Last week, 500 personalized coupons were sent via SMS. 75 were redeemed in-store (15% conversion). Notably, the rice coupon had the highest uptake (20 redemptions). This generated approximately ₹25,000 in sales attributable to the campaign.

Manager: Nice. That's a good result. Let's prepare a similar campaign for cooking oils next week.

AI System: Acknowledged. I will analyze purchase histories to target customers who often buy cooking oil, and prepare a coupon campaign for manager review.

Manager: Excellent. Thanks.

(Here the manager uses the AI for insight on customer needs and verifies stock, demonstrating how AI links queries to operational action. It also tracks marketing efficacy.)

Export-Import Industry

AI Solutions in Export-Import: For businesses involved in export-import and trading, Shivohini's AI provides logistics tracking, client relationship management, and financial process automation. Key features include:

- **Order Tracking:** The AI monitors international shipments and provides real-time status updates. Both customers and business owners can query the system for the latest info on a shipment's location, estimated arrival, or any delays (integrating with tracking APIs).
- **Repeat Customer Marketing:** The system analyzes customer orders to identify loyal clients. It then sends targeted promotions or personalized deals to

encourage repeat business. For example, if a buyer regularly imports goods every quarter, the AI might offer them a loyalty discount on the next shipment, or alert them to related products they might need.

- **Automated Invoicing & Payment Follow-Up:** The AI generates invoices for each order and can automatically send them to clients. It also keeps track of payment due dates; if a payment is late, the AI can send polite reminder messages to the client or notify the finance team to follow up. This ensures smoother cash flow without manual tracking.

Example Use Case: International Order Lifecycle with AI Assistance

1. **Order Placement:** A client places an order to import a batch of products from India to the UAE. The AI Sales Person (adapted for B2B) captures all order details via a chat or portal, confirming quantities, price, and shipping method. It then triggers the backend systems to process the order.
2. **Shipment Initiation:** Once the shipment is dispatched, the AI logs the tracking number and carrier details. It might send the client a message: "Your order #789 has been shipped on Nov 10. Tracking ID: ABC123. Estimated arrival: Nov 18."
3. **Real-Time Tracking Queries:** As the goods are in transit, the client can at any time ask the AI, "Where is my shipment #789 now?" The AI will fetch the latest status from the carrier's API. For example: "Your shipment cleared customs in Dubai and is in transit to the distribution center. It's expected to be delivered by tomorrow evening."
4. **Proactive Delay Alerts:** If there's a delay (say a customs hold or weather issue at sea), the AI proactively notifies the client: "Your shipment #789 is experiencing a delay due to customs clearance taking longer than expected. New ETA: Nov 20. We're monitoring and will update you." Simultaneously, it alerts the company's logistics manager about the delay.
5. **Invoice Automation:** Once the shipment is delivered, the AI generates the invoice for that order. It itemizes the products, adds shipping fees, applicable taxes, etc., and emails it to the client's accounts department. The message might include, "Thank you for your business. Please find Invoice #789 attached. Payment is due by Dec 5."
6. **Payment Follow-Up:** The AI tracks that invoice. If payment is not recorded by Dec 5, the next day it sends a friendly reminder: "Dear Client, this is a reminder that invoice #789 (₹500,000) was due yesterday. Please ignore if already paid. Let us know if you have any issues with the payment." If the payment gets very overdue, the AI could escalate to a human with a summary of attempts.
7. **Repeat Business Promotion:** The AI notices this client orders quarterly and has placed 4 orders this year (repeat customer). So, it triggers a marketing action: maybe a personalized offer is sent like "On your next order, enjoy a 5% discount as thank you for being a loyal partner." This might coincide with the quarter's end or a time the AI predicts they usually place a new order (based on pattern).
8. **Post-order Support:** If the client has any questions, they can ask the AI assistant. For example, "Can you send me the import documentation for order #789?" The AI can retrieve the bill of lading, customs forms, etc., and provide them instantly.

This flow shows the AI handling end-to-end process: keeping the client informed (improving transparency), reducing the admin load (by automating invoices and reminders), and nurturing the client relationship (through personalized offers).

Sample Chatbot Conversations

Conversation 1: Client and AI Logistics Tracker (Customer Query)

Client: Hi, I need an update on my shipment INV-1005.

AI Assistant: Hello! Shipment INV-1005 (5 containers of textiles to UK) is currently at sea, in transit. It departed Mumbai Port on Nov 12 and is due to arrive at Southampton Port by Nov 19.

Client: Can you confirm if it cleared export customs?

AI Assistant: Yes, the shipment cleared export customs in India on Nov 11. All documentation was in order. I have the export clearance certificate if you need it.

Client: That's fine. And once it arrives, how long for delivery to my warehouse?

AI Assistant: After port arrival, it usually takes 2 days for unloading and customs at UK side, then ground transport. Estimated delivery to your warehouse is Nov 22. I'll keep you updated.

Client: Great, thank you.

AI Assistant: You're welcome! I will notify you immediately if there are any changes or delays.

(The AI provided detailed tracking information and was ready with documents if needed.)

Conversation 2: AI Assistant and Export Business Owner (Internal Persona)

Owner: Good morning AI, how are our shipments doing today? Any alerts?

AI Assistant: Good morning! All 5 active shipments are on track. No delays reported as of now. Shipment INV-1008 to Dubai arrived at port this morning and is awaiting customs clearance. I'll flag if there's any hold-up.

Owner: Excellent. Did we send invoices for the two orders delivered last week?

AI Assistant: Yes. Invoices for orders #1003 and #1004 were sent on Nov 10. Both are due by Dec 10.

Owner: Have those clients opened the invoice email?

AI Assistant: Client for #1003 (Alpha Traders) opened the invoice email same day. Client for #1004 (Beta Imports) has not opened the email yet, according to the read receipt.

Owner: Hmm, give Beta Imports a gentle reminder about the invoice, maybe they missed it.

AI Assistant: Certainly. I have sent a polite reminder email to Beta Imports regarding Invoice #1004, including the invoice attachment again.

Owner: Thank you. Also, how many repeat orders did we get this quarter?

AI Assistant: This quarter, we received 15 repeat orders (clients who have ordered before). That's a 25% increase from last quarter. Notably, Delta Exports made 3 orders (one each month). I sent them a loyalty thank-you with a 5% discount offer on their next order, as per our policy.

Owner: Great. Let's keep them happy. Finally, show me any outstanding payments over 30 days.

AI Assistant: Outstanding payments over 30 days: (1) Invoice #987 – ₹200,000 – 45 days overdue (Client: Gamma Corp). (2) Invoice #990 – ₹150,000 – 32 days overdue (Client: Horizon Co.). I have already sent reminders at 30 days. Perhaps a direct call might be needed for Gamma Corp.

Owner: I'll handle that, thanks.

(The owner checks on shipments and finances; the AI provides a quick operational snapshot and has already handled some tasks like reminders and loyalty offers.)

Conversation 3: Import Client and AI Virtual Agent (Placing a Reorder)

Client: Hello, I'd like to reorder the same batch we got last time – 100 units of product X.

AI Sales Agent: Hi! Sure, I can help with that. I see your last order was 100 units of Product X (model B) in September. Do you want the same specifications?

Client: Yes, exactly the same. What's the price this time?

AI Sales Agent: The unit price is still ₹5,000 each, so 100 units will be ₹5,00,000. Shipping to your location via air freight is ₹20,000 (delivery in 7 days) or via sea is ₹10,000 (delivery in 20 days). Which shipping do you prefer?

Client: Let's do air freight, need them quickly.

AI Sales Agent: Okay. I've created order #1010 for 100 units of Product X with air freight. Total cost ₹5,20,000. I've applied your 5% loyalty discount, bringing it to ₹4,94,000.

Client: Oh, thank you for the discount!

AI Sales Agent: You're a valued customer. □ The proforma invoice is being emailed to you now. Once you confirm and make the advance payment, we'll dispatch immediately. Is there anything else you need?

Client: No, that's all. I'll check the email.

AI Sales Agent: Great! Thank you for your business. Feel free to chat if you have any more questions.

(The AI made reordering very smooth and even proactively applied a loyalty discount, reinforcing the customer's positive experience.)

Logistics and Supply Chain Industry

AI Solutions in Logistics & Supply Chain: In logistics companies or departments, Shivohini's AI helps automate communication about shipments, manage documentation, and streamline repetitive tasks in supply chain operations. Notable features:

- **Automated Shipment Updates:** The AI system sends timely notifications about shipment status to both customers and internal stakeholders. For instance, when a delivery truck departs, arrives at a hub, or is running late, the AI emails or texts updates to relevant parties (customers awaiting delivery, or managers overseeing fleet operations).
- **Billing & Invoicing Automation:** Just like in export-import, the logistics AI generates and distributes invoices for shipments or services rendered. It can calculate transportation costs, add any surcharges (fuel, duties), and send

invoices immediately upon delivery completion. It also manages payment tracking and reminders.

- **Virtual Logistics Assistant:** A conversational assistant can answer queries on the company's website or internal systems, providing information such as shipping rates, delivery ETAs, package tracking, or even internal data like inventory levels if integrated with a warehouse management system. It essentially serves both customers (externally) and employees (internally) with supply chain information on demand.

Example Use Case: End-to-End Delivery Coordination

1. **Order Creation:** Suppose a customer books a courier shipment through a logistics company's online portal. The AI acknowledges the booking and schedules a pickup. The customer might get a chat message: "Your package pickup is scheduled for today by 4 PM. Tracking ID: 12345."
2. **Real-time Customer Updates:** As the driver picks up the package and scans it, the AI detects this event (via integration with the scanning system) and sends an update: "Package 12345 has been picked up from origin." As it moves through sorting facilities, the customer receives updates like "In transit – departed from Mumbai Hub" and later "Arrived at Delhi Hub."
3. **Internal Alerts for Exceptions:** Internally, if a shipment is delayed or a route is congested, the AI can alert the logistics coordinator: "Route 5 is experiencing heavy traffic, delivery truck ID 77 will be 30 minutes late." It might even suggest rerouting options if integrated with mapping services.
4. **Delivery Confirmation:** When the delivery is done and signed for (say via a driver's handheld device), the AI triggers a final message to the customer: "Your package 12345 was delivered on Nov 15 at 10:30 AM. Recipient: J. Doe." It also marks the job complete in the system.
5. **Automated Invoicing:** If this was a billable delivery (e.g., cash on delivery or a business client with monthly billing), the AI prepares the invoice immediately. For one-off retail customers, maybe they paid upfront, but for business accounts, it might accumulate and invoice periodically. Either way, the invoice for that delivery, or a summary invoice, is sent out.
6. **Virtual Assistant Support:** During this whole process, if the customer or even an internal dispatcher has questions, they can ask the AI:
7. Customer might ask: "When will my package 12345 arrive?" The AI can respond with the ETA (e.g., "It's on vehicle 77 out for delivery, expected by noon today").
8. An internal user might ask: "How many deliveries are pending today in Zone 4?" The AI can fetch: "There are 5 pending deliveries in Zone 4, all are on track except one delayed by traffic."
9. **Post-Delivery Feedback:** After the delivery, the AI may prompt the recipient for feedback: "Please rate your delivery experience" or for business clients, provide a summary of monthly performance: e.g., "This month: 98% on-time delivery, average transit time 2.1 days. Please share any issues."

Sample Chatbot Conversations

Conversation 1: Customer and AI Tracking Assistant (Package Status)

Customer: Hey, I'm expecting a package (ID 98765). Can you tell me where it is?

AI Assistant: Hello! Package 98765 is currently out for delivery in Bangalore. Our records show the delivery agent is approximately 5 km away from the destination. ETA for delivery is about 45 minutes (around 3:30 PM today).

Customer: Great. And do I need to be there to sign?

AI Assistant: Yes, it requires a signature. If you aren't available, you can reschedule or authorize someone else. Would you like to reschedule the delivery?

Customer: No, I'll be there. Thanks for the update.

AI Assistant: You're welcome! I'll send a confirmation once it's delivered.

(Here the AI provides live tracking info and proactively offers rescheduling.)

Conversation 2: Internal Logistics Manager and AI System (Fleet Update)

Manager: AI, give me a status update on today's deliveries.

AI System: Good afternoon. 120 deliveries were scheduled today. So far, 90 have been completed (75% done). 10 are running behind schedule by more than 30 minutes. The remaining 20 are on track.

Manager: What's causing the delays?

AI System: Out of the 10 delayed: 6 are due to traffic congestion on NH8 (an accident caused a jam), 2 had vehicle issues (tire puncture, truck ID 54, and battery issue, truck ID 61 – backup sent), and 2 had address issues (wrong address provided, contacting recipients).

Manager: Understood. Did the system alert customers about those delays?

AI System: Yes, all affected recipients were sent an SMS about the delay and the updated ETA.

Manager: Good. Also, generate the invoices for our corporate clients for this week's shipments.

AI System: Invoices for 3 corporate clients (ABC Corp, XYZ Ltd, and Global Traders) have been generated and emailed to their accounts payable departments. I've also updated the accounts receivable ledger.

Manager: Excellent. Lastly, how many new delivery requests came via the chatbot on our website today?

AI System: Today, 15 new pickup requests were placed via the website assistant. 12 have been scheduled and dispatched. 3 are set for tomorrow.

Manager: Great. Thanks.

(The manager gets a comprehensive update and sees that the AI is handling communications and financial paperwork automatically.)

Conversation 3: Warehouse Staff and AI Inventory Assistant (Internal Persona)

Warehouse Staff: AI, I'm trying to find shipment #556 in the warehouse. Can you tell me where it was stored?

AI Assistant: Shipment #556 (5 pallets of electronics) is in Warehouse Zone B, Aisle 3, Section 2. It arrived yesterday and is scheduled to go out tomorrow.

Staff: Thanks. Also, has the incoming truck from Mumbai arrived yet?

AI Assistant: Truck #MH-07 arrived at 2:15 PM and is currently unloading at Dock 4. It's about 50% unloaded now.

Staff: Okay. After unloading, remind me to generate the receiving report.

AI Assistant: Certainly. I'll notify you once unloading is complete. Also, I will draft the receiving report with item counts for your review.

(This shows the AI being used by operations staff to pinpoint inventory and to coordinate tasks like unloading and reporting.)

Education Industry

AI Solutions in Education: In educational institutions (schools, universities, training centers), Shivohini's AI serves both academic and administrative roles. Key features include:

- **Multilingual Lecture Support:** The AI can translate or transcribe lectures in real-time. This includes speech-to-text transcription of a teacher's lecture (which can help students take notes or accommodate those with hearing impairment) and speech-to-speech translation into local languages for students more comfortable in another language. For instance, an English lecture could be simultaneously translated into Hindi and delivered via students' devices or a headphone system.
- **Marketing Assistant (Admissions):** The AI helps the education institute's outreach by gathering and analyzing "Contact Us" inquiries or application data. It engages prospective students by answering questions about courses, fees, campus facilities, etc., and can follow up with tailored information. It can identify what potential students ask most and provide insights to the admissions team (e.g., many inquiries about scholarship availability).
- **Virtual Student Assistant:** A 24/7 AI assistant is available for students, parents, and faculty on the school/university website or app. Students can ask academic questions, get homework help, query their attendance or grades, or ask administrative questions ("When is the exam form deadline?"). Parents might ask about school policies or get updates on their child's performance. Faculty can use it to get quick info like academic calendar dates or tech support.

Example Use Case: AI-Augmented Classroom and Student Support

1. **Live Lecture Transcription:** A professor is giving a lecture in English. The AI, connected to a microphone feed, transcribes the speech in real-time to text displayed on a screen (for all students to see) or on individual tablets. This helps students follow along, especially if the audio is unclear or if someone is hard of hearing.
2. **Language Translation:** Among the students, a subset is more fluent in Spanish. They have an option on their devices to get a live translated caption or audio. The AI concurrently translates the lecture's content from English to Spanish (speech-to-text in Spanish, or even speech-to-speech via a synthesized voice). Now those students can understand the material better in their native language.
3. **After-class Notes:** The AI compiles the transcript and provides a summary of the lecture's key points at the end (like an automatic note distribution). It might highlight important definitions or save the professor's slides with transcribed commentary.

4. **Student Inquiry Assistant:** Later that evening, a student is doing homework and has a question: “What did the professor say about Multivariable Calculus chain rule?” They ask the AI Student Assistant (via the campus app). The assistant searches the day’s lecture transcript or knowledge base and provides the explanation or direct quote from the lecture about the chain rule. It might also offer an example problem or additional resources, acting as a tutor.
5. **Administrative Query:** A parent logs into the school’s website and uses the AI chat: “When is the last date to pay the semester fees?” The AI looks up the academic calendar and replies: “The deadline for semester fee payment is January 31. You can pay online through this portal [link].” The parent then asks, “How do I apply for a transport facility for my child?” The AI guides them step-by-step on the transport application process.
6. **Admissions Follow-up:** Separately, a prospective student visits the university website and asks via chat, “Is there any scholarship for international students?” The AI provides details about scholarships. It then asks if they’d like more info. The student says yes, so it collects their email. Later, the AI sends a personalized email with program brochures and scholarship forms, and notifies the admissions team of this hot lead. If the student goes silent, the AI might follow up in a week with a polite reminder or additional info.
7. **Feedback to Staff:** The AI compiles frequent questions from prospective students and shares with the marketing team that “40% of inquiries from international students are about scholarships, and 30% about housing.” This helps the school adjust their informational materials to highlight those topics prominently.

Sample Chatbot Conversations

Conversation 1: Student and AI Academic Assistant (Homework Help)

Student: (on university app) I’m stuck on problem 5 from today’s calculus homework.

AI Academic Assistant: Sure, I can help. Problem 5 is about finding the derivative using the chain rule, correct?

Student: Yes, I’m not sure how to start.

AI Academic Assistant: Let’s break it down. The function given is $y = \sin(3x^2)$. To apply the chain rule, identify the outer function and inner function. Here, the outer function is $\sin(u)$ and the inner is $u = 3x^2$. The chain rule says $dy/dx = \cos(u) * du/dx$. For this problem: $du/dx = 6x$. So $dy/dx = \cos(3x^2) * 6x$.

Student: Okay, that makes sense. So the answer would be $6x\cos(3x^2)$.

AI Academic Assistant: Correct! Also, remember in today’s lecture, the professor gave a similar example: he differentiated $\sin(2x)$ into $2\cos(2x)$. This problem just extends that pattern. Do you need help with any other part of the homework?

Student: No, that was the main issue. Thanks a lot!

AI Academic Assistant: You’re welcome. Good luck with the rest of your homework, and if you need any clarification, I’m here 24/7.

(The AI guided the student through a concept, referencing the lecture content to reinforce learning.)

Conversation 2: Parent and AI School Assistant (General Queries)

Parent: Hello, I'm Alice's mother. Can I know how she's performing in her classes?

AI School Assistant: Hello! For privacy, please login to verify your parent account.

[Parent logs in] Thank you. Alice is in Grade 8. Her latest grades: Mathematics – A, Science – B+, English – A-. Her attendance this term is 95%.

Parent: That's good to hear. When is the next parent-teacher meeting?

AI School Assistant: The next parent-teacher meeting is on December 5th at 4 PM. You can RSVP through this chat. Would you like me to register you for it?

Parent: Yes, please do.

AI School Assistant: Done! You are registered for the Dec 5th meeting. You'll receive an email confirmation.

Parent: Also, how do I apply for a leave of absence for Alice? We have a family event next Friday.

AI School Assistant: You can apply for leave via the parent portal. I can guide you: 1) Go to "Attendance & Leave" section, 2) Click "New Leave Request", 3) Enter the dates and reason, 4) Submit. Shall I open that page for you?

Parent: Yes, that would be helpful.

AI School Assistant: *[Opens leave request form]* Here it is. I've pre-filled Alice's name. You just need to select the date (next Friday) and reason. Let me know if you need anything else.

Parent: Got it, thank you. That's all.

AI School Assistant: You're welcome! I'm here if you have any more questions.

(The AI handles academic info queries securely and guides the parent through administrative tasks.)

Conversation 3: Prospective Student and AI Admissions Assistant

Prospect: Hi, I'm interested in the B.Tech Computer Science program. Can I ask some questions?

AI Admissions Assistant: Hello! Absolutely, I can help with information about the B.Tech (CSE) program. What would you like to know?

Prospect: What is the eligibility and admission process?

AI Admissions Assistant: The eligibility for B.Tech CSE is 60% or above in high school (with Physics, Chemistry, Math). Admission is through our entrance exam or JEE score. You need to fill out an application form, then if shortlisted, appear for counseling. The full process details are here: *[provides link]*.

Prospect: And what about scholarships? Any for merit students?

AI Admissions Assistant: Yes, we offer merit-based scholarships. Students scoring above 90% in the entrance exam get 50% tuition waiver. There are also scholarships for top performers each year. We also have an "International Student Scholarship" if you're applying from abroad.

Prospect: That's great. Can I get a brochure or something?

AI Admissions Assistant: Certainly! Could you provide your email address? I will send you the program brochure, scholarship form, and a link to the application portal.

Prospect: Sure, it's johnsmith@example.com.

AI Admissions Assistant: Thank you. I've sent the materials to johnsmith@example.com. (Please check your inbox, including spam folder.) Do you have any other questions?

Prospect: Not right now, I'll read these first. Thanks for the help.

AI Admissions Assistant: You're welcome! Feel free to chat anytime if you need more information. Good luck, and we hope to receive your application!

(The AI effectively acted as an admissions counselor, providing details and sending follow-up info, capturing a lead.)

Real Estate Industry

AI Solutions in Real Estate: Shivohini's AI in the real estate domain functions as a virtual real estate agent and marketing assistant. It helps property businesses manage inquiries, match clients with properties, and streamline agent tasks. Key features include:

- **Marketing Assistant (Property Info & Feedback):** The AI can automatically send property details (brochures, images, specifications) to interested customers and collect their feedback or requirements. For instance, if a prospect asks about a 3BHK apartment, the AI might email or chat a link to an info page and later ask "Did that property meet your needs? Would you like to see more options?"
- **Agent Availability & Property Comparison:** The AI provides real-time information on agent schedules and can help schedule site visits. It knows which real estate agents are free at what times and can book appointments for property viewings. It can also present side-by-side comparisons of multiple properties if a client wants to evaluate options (e.g., "Compare Property A and B – what are the differences in price, area, amenities?").
- **24/7 Customer Queries:** (Though not explicitly listed in bullets, likely) an AI virtual assistant on the agency's website that answers common questions about listings, financing options, document procedures, etc., any time of day. This reduces the load on agents for routine questions and captures leads after hours.

Example Use Case: Property Inquiry to Site Visit Booking

1. **Initial Inquiry:** A potential buyer visits the real estate agency's website at 9 PM and uses the chat: "I'm looking for a 3-bedroom apartment in downtown with 2 bathrooms and parking." The AI Virtual Assistant responds immediately with a few matching listings from the database, each with brief details and price ranges.
2. **Property Details Sharing:** The user clicks on one listing (Property A) for more info. The AI provides a detailed description: "Property A – 3BHK, 1200 sqft, \$300k, located in Downtown Heights, includes 2 baths, 1 parking spot, built 2018." It also offers, "Would you like to see photos or a virtual tour?" The user says yes, and the AI either displays an image gallery or gives a link to a virtual tour video.
3. **Comparison:** The user is curious about another listing (Property B). They ask, "How does Property B compare to A?" The AI then produces a comparison: "Property B is 1300 sqft at \$320k, slightly larger, with an extra half-bath. Location is 2 km further from city center than Property A. Both have parking and similar amenities. Property B is newer (built 2020 vs 2018)."
4. **Feedback Collection:** The AI asks which one they like more or if they have preferences. The prospect indicates they prefer Property A due to location. The

AI notes this feedback (for the agent's knowledge and for refining future suggestions).

5. **Schedule Viewing:** The user wants to visit Property A. They say, "Can I see it this weekend?" The AI checks the integrated agent calendar and replies, "Our agent Sarah can show you Property A on Saturday at 11 AM. Would that work for you?" The user confirms. The AI schedules the appointment, sends the prospect a calendar invite and details (address, agent contact).
6. **Agent Notification:** The AI also instantly notifies the agent (Sarah) about the scheduled visit, including the client's name, contact, and the property to be shown. It may also include the conversation summary, like "Client is very interested in location, mentioned parking is a must, compared A vs B and chose A."
7. **Follow-up:** After the viewing, the AI might follow up with the prospect via email or chat: "Hope you liked the visit to Property A. Do you have any feedback or questions?" If the client says "I liked it but the price is slightly high," the AI can note that and maybe respond with financing options or offer to show similar properties in a slightly lower price range.
8. **Ongoing Nurturing:** If the client doesn't immediately decide, the AI continues to engage over weeks – sending new listings that meet their criteria or notifying them if Property A's price changes. Essentially, it nurtures the lead.

Sample Chatbot Conversations

Conversation 1: Home Buyer and AI Property Assistant (Customer Inquiry)

Buyer: Hi, I am looking for a 4-bedroom house in the suburbs, around 2500 sqft. Any listings?

AI Assistant: Hello! Yes, we have several listings that match 4 bedrooms ~2500 sqft in suburban areas. For example, **Listing 1:** 4 BHK, 2400 sqft, Green Acres community, priced at ₹1.5 Cr. **Listing 2:** 4 BHK, 2600 sqft, Lakeview Estate, priced at ₹1.6 Cr. Would you like more details on any of these?

Buyer: Tell me about the Lakeview Estate one.

AI Assistant: Listing 2 – Lakeview Estate: It's a 4 bedroom, 3 bathroom independent house, 2600 sqft, with a lake view. It includes a garden and two-car garage. Built in 2019. Amenities: community swimming pool, gym, and park. Price is ₹1.6 Cr. Property ID is #LAKE45.

Buyer: That sounds interesting. How does it compare to the Green Acres one?

AI Assistant: Green Acres (Listing 1) is slightly smaller at 2400 sqft and a bit older (built 2015). It's priced slightly lower at ₹1.5 Cr. It has 4 beds, 3 baths, one garage. Both communities have good amenities, but Lakeview Estate has a water view and newer construction. Green Acres has a slightly bigger yard though.

Buyer: I really like the idea of a lake view. Can I visit the Lakeview house?

AI Assistant: Certainly! Our agent who handles Lakeview Estate is available. Let's see... This weekend, slots open are Saturday 4 PM or Sunday 11 AM. Which do you prefer?

Buyer: Sunday 11 AM is good.

AI Assistant: Great, I've booked a site visit for **Sunday at 11 AM** for Lakeview Estate #LAKE45. You'll meet **Agent Rahul** at the property (I'll send the address and a

calendar invite to your email). Is there anything else?

Buyer: That's all, thanks!

AI Assistant: You're welcome! I've emailed you the visit details along with the property brochure. Agent Rahul will be in touch. Good luck, and enjoy the viewing!

(The AI helped the buyer find a suitable listing, compare options, and set up a viewing seamlessly.)

Conversation 2: Real Estate Agent and AI Assistant (Internal Persona)

Agent (Sarah): AI, I'm about to meet a client for a 3BHK apartment viewing. Can you brief me on what we know about the client?

AI Assistant: The client is Mr. Rajiv, viewing 3BHK at Downtown Heights (Property ID #DH101). He contacted us via the website. Noted preferences: wants a city center location, parking is essential, budget up to ₹1.2 Cr. I showed him two options; he preferred Downtown Heights over another due to location. He also inquired about financing options, so he might ask about home loans.

Agent: Good to know, thanks. Did he receive the property documents?

AI Assistant: Yes, I emailed the brochure and floor plan to him. He viewed them. Also, minor note: he thought the price was a bit high, so be ready to discuss negotiation or justify the value (the lake view, etc., in that case it was location in city center).

Agent: Got it. After the viewing, I'll update you. Thanks.

(The agent used the AI to quickly get up to speed on the lead's context and needs, so she can tailor her approach.)

Conversation 3: Renter and AI Assistant (Tenant Persona Inquiry)

Renter: Hi, I'm relocating for work. Do you have any 2BHK apartments for rent near Tech Park?

AI Assistant: Hello! Yes, there are a few 2-bedroom apartments for rent near Tech Park. For example: **Option A:** 2BHK in Skyline Towers, 5 km from Tech Park, ₹25,000/month. **Option B:** 2BHK in Lakeside Apartments, 3 km from Tech Park, ₹30,000/month. Would you like details or more options?

Renter: I prefer closer, so tell me about Lakeside Apartments.

AI Assistant: Lakeside Apartments – 2BHK: It's 1200 sqft, semi-furnished, 2 baths, with a balcony overlooking a lake. It's 3 km (10 min drive) from Tech Park. Rent is ₹30,000/month with a 10-month deposit. Amenities include a gym, pool, and reserved parking. Available from next week.

Renter: Sounds good. Is the rent negotiable?

AI Assistant: Typically, the rent is fixed, but sometimes a slight negotiation is possible for long-term leases. I can flag your interest and see if the owner would consider ₹28,000. Would you be signing a year lease or more?

Renter: Likely 1 year at least.

AI Assistant: Understood. I will mention that to the owner. Would you like to schedule a viewing of this apartment?

Renter: Yes, tomorrow evening if possible.

AI Assistant: Checking availability... Tomorrow (Tuesday), we have an agent available at 6 PM. Shall I book that?

Renter: Yes, please.

AI Assistant: Done. You're booked for a viewing at Lakeside Apartments, Tuesday 6

PM. I've sent you the address and agent contact (Ms. Priya) via SMS. Good luck! After the visit, I can assist with the rental application if you decide to proceed.

(This shows an AI handling rental inquiries similarly, including negotiation hint and scheduling a viewing.)

Finance and Accounts Department

AI Solutions in Finance & Accounts: For corporate finance departments or accounting firms, Shivohini's AI assists with automating routine financial tasks, data analysis, and responding to queries related to financial information. (Note: The provided sources had a duplication error for finance, but logically these are possible applications.)

- **Automated Financial Reports:** The AI can generate regular financial reports (like monthly expense summaries, budget vs actual reports, etc.) by pulling data from accounting software. It organizes the data into human-readable formats or dashboards, saving analysts time.
- **Expense Analysis & Anomaly Detection:** The AI monitors transactions and categorizes expenses. It can flag anomalies or unusual spending patterns. For example, if a department's expenses spike abnormally in one month or if a particular expense looks outside approved policy, the AI alerts the finance team.
- **Accounts Query Chatbot:** Internally, employees or managers can ask the AI chatbot questions about finances. For instance, "What's the current quarter's marketing spend?" or "Has vendor X been paid last month?" The AI, integrated with the accounting system, can fetch these answers quickly. It might also be able to answer policy questions like "What's the procedure to file a travel reimbursement?".
- **Invoice Processing:** The AI can assist with accounts payable by reading incoming invoices (OCR to extract data) and entering them into the system, even matching them against purchase orders. For accounts receivable, it keeps track of customer payments due and can send reminders (similar to earlier described in Export/Logistics).
- **Payroll Assistant:** It might handle payroll queries from employees through a chatbot. For example, an employee could ask "Can you email me my last 3 pay slips?" and the AI will securely provide them. Or answer "How is the income tax on my salary calculated?" with an explanation referencing the payroll data and tax rules.

Example Use Case: Monthly Close and Query Assistance

1. **Month-End Close:** As the month ends, the AI automatically compiles the P&L (Profit & Loss) statement and balance sheet from the accounting system. It consolidates all entries, calculates totals, and formats a draft report. It also generates departmental expense breakouts and highlights notable changes (e.g., "Travel expenses increased 20% from last month, primarily due to the annual sales conference expense.").
2. **Manager Review:** The CFO or finance manager receives these draft reports on the first of the month. The AI includes commentary: "Revenue increased 5%

MoM, largely due to a big order from Client X. Expenses up 3%, mainly marketing spend. Net profit up 7%. Cash flow from operations is strong.”【No direct source, logical extension】. The manager can then adjust or add narrative as needed, but a lot of groundwork is done.

3. **Anomaly Detection:** The AI’s continuous monitoring might have caught something: say an unusually high office supplies purchase. It flags, “Office Supplies expense is ₹50k this month vs average ₹5k. Check if this is an error or one-time event.” The finance team investigates and finds it was a bulk buy of new equipment – okay. They mark it as explained.
4. **Employee Inquiry:** Mid-month, an employee pings the finance chatbot: “What’s the status of my expense reimbursement for the trip?” The AI checks the expense system: “Your travel expense claim from Oct 20 (₹8,000) was approved and is scheduled for reimbursement in the next payroll on Oct 31.” The employee asks, “Can I get a breakdown of which items were approved?” The AI provides: “₹5,000 for flight, ₹2,500 hotel, ₹500 meals – all approved. No disallowed items.”
5. **Vendor Payment Check:** An operations manager asks the bot, “Has invoice INV-454 from Supplier ABC been paid?” The AI looks up accounts payable: “Invoice INV-454 (₹1,20,000) was paid on Nov 10 via NEFT transaction ID 123XYZ. Expected to reach the supplier’s account by Nov 11.” If it wasn’t paid, the AI could give status like “It’s scheduled for payment on Nov 15” or “It’s pending approval.”
6. **Budget Planning Assistance:** During budgeting season, the AI helps by forecasting based on historical data. A finance analyst might ask, “AI, what was the average monthly spend on software licenses this year? Need to project for next year.” The AI quickly calculates: “Average spend on software licenses was ₹1,00,000 per month in 2025. It showed a slight upward trend of ~2% each quarter. For 2026, a projected monthly baseline could be around ₹1,10,000 accounting for new hires.” This gives a starting point for budgeting.
7. **Internal Compliance:** If someone tries to raise a purchase request that exceeds budget or doesn’t follow process, the AI can immediately warn: “This expense exceeds the allocated budget for Q4 by ₹50k. Please provide justification or it may need approval from CFO.” This ensures financial controls are observed with AI vigilance.

Sample Chatbot Conversations

Conversation 1: Team Lead and AI Finance Assistant (Budget Query)

Team Lead: Hey FinanceBot, how much of my team’s travel budget is left for this quarter?

AI Finance Assistant: Hello! Team Alpha’s travel budget for Q4 was ₹5,00,000. So far, ₹3,50,000 has been spent (70%). Remaining budget is ₹1,50,000.

Team Lead: Got it. Can you break down that spend? Mostly on conferences?

AI Finance Assistant: Break-down of Q4 travel spend for Team Alpha: ₹2,00,000 on flight tickets (mostly two overseas conferences), ₹1,00,000 on hotels, and ₹50,000 on local transport and meals. The large expenses were the Developer Summit (₹1,20,000) and Marketing Expo (₹80,000).

Team Lead: Thanks. Also, did Finance approve our extra budget request for training?

AI Finance Assistant: Checking... Yes, an additional ₹1,00,000 was approved for Team Alpha's training budget on Nov 1. I have updated the system, so your available training budget increased to ₹3,00,000.

Team Lead: Perfect. Thanks.

(The AI quickly provides budget utilization details and status of a request.)

Conversation 2: Employee and AI Payroll Assistant (Personal Finance Info)

Employee: Hi, how can I get my Form-16 for last financial year?

AI Payroll Assistant: Hello! You can download your Form-16 for last year directly. I've fetched the document from our records.

DownloadForm – 16forFY2024 – 2025

. Let me know if you have any issue accessing it.

Employee: Thanks. Also, what's my current leave balance and last month's salary net amount?

AI Payroll Assistant: Your current leave balance: 12 vacation days, 5 sick days. Your net salary for Oct 2025 was ₹80,000. Gross was ₹1,00,000 and deductions were ₹20,000 (tax + PF).

Employee: Can you explain why the deduction was higher than September?

AI Payroll Assistant: In Oct 2025, your taxable income slightly increased due to the annual bonus included, raising the tax deduction. Specifically, an extra ₹5,000 TDS was cut from the bonus. That's why total deductions increased (₹20k vs ₹15k in Sep).

Employee: Understood. Thank you.

(The AI serves as an HR/Finance helpdesk, retrieving documents and explaining payroll differences.)

Conversation 3: Accounts Payable Clerk and AI (Invoice Processing)

Clerk: FinanceBot, I have a vendor invoice here. Can you extract details? *[uploads PDF]*

AI Assistant: Extracting data... Invoice #77845 from "Global Stationers Ltd." Date: Nov 5, 2025, Amount: ₹45,000, Due: Dec 5, 2025. Line items: Paper reams – ₹30,000, Pens – ₹15,000.

Clerk: Enter this into our accounting system.

AI Assistant: Done. Invoice #77845 has been logged in Accounts Payable. It's tagged to Office Supplies expense account. Would you like me to schedule payment on the due date?

Clerk: Yes, schedule NEFT on Dec 5.

AI Assistant: Payment scheduled via NEFT on Dec 5, 2025. Transaction will require approval from the manager by Dec 3 (I've sent them a notification). Anything else?

Clerk: Check if last month's electricity bill was paid.

AI Assistant: Last month's utility invoice (Electric Co., ₹12,000) was paid on Oct 30. Receipt is filed in the Utilities folder.

Clerk: Good. Thanks.

(The AI helps process an invoice automatically and confirms other payments.)

Overall Chatbot Goals and Use Cases

Shivohini TechAI's chatbot and AI agent solutions are designed with several overarching goals across all industries and functions:

- **Customer Support:** Provide instant, round-the-clock support to customers. The chatbot serves as a first line of support to answer FAQs, assist with common tasks (like tracking an order or booking a service), and handle high volumes of inquiries without waiting. This improves customer satisfaction by offering help 24/7 and frees human support staff to focus on complex issues. For example, in a hotel context, the AI concierge answers guest questions and requests at any hour, and in education, the AI assists students with course queries whenever they arise.
- **Sales and Lead Conversion:** Act as a tireless sales representative that engages potential customers, qualifies their needs, and drives them toward a purchase or decision. The chatbot's goal here is to ensure no sales opportunity is missed – every website visitor or interested prospect gets immediate attention and information. It can nurture leads through personalized interactions (sending follow-up info, scheduling demos) and even close sales for simpler products or services. The AI Sales Person embodiment is specifically aimed at boosting sales throughput by handling the initial stages of the sales funnel autonomously.
- **HR and Internal Queries:** Serve as an internal helpdesk for employees (HR, IT, or finance related queries). By handling routine questions like “How to reset my password” or “What’s the leave policy?”, the AI reduces the burden on HR and IT teams. For HR, the chatbot can also guide employees through processes (leave applications, benefit enrollment) and assist in recruitment processes (answering candidate queries, scheduling interviews as seen in the HR Agent capabilities). The goal is to streamline internal operations and give employees quick answers without manual intervention.
- **Industry-Specific Guidance:** Offer expert guidance tailored to industry needs. This means the chatbot is not just a generic assistant, but one trained on industry knowledge and best practices. For instance, in **finance**, it can answer regulatory compliance questions or provide financial advice snippets within the boundaries set by the organization. In **sports**, it can give training tips or sports rules explanations. In **real estate**, it educates clients about mortgage options or property trends. Essentially, it acts as a domain expert. The goal is to provide value-added information that might normally require consulting a specialist or digging through manuals.
- **Operational Efficiency:** Beyond direct interactions, the chatbots/AI agents aim to automate background processes that contribute to efficiency. They fetch data, generate reports, send reminders, and ensure processes move along without human prompting. For example, automatically sending shipment updates or generating invoices as soon as a delivery completes – these reduce delays and errors in operations. The overall goal is a smoother operation where repetitive tasks and communications are handled by AI, allowing humans to focus on strategic or creative work.

- **Enhanced User Engagement:** By being interactive and responsive, the chatbot keeps users engaged. Whether it's a customer browsing a website who spends more time because the chatbot can show them content, or an employee who actually uses the internal knowledge base because it's as easy as chatting with the bot, the goal is to increase engagement with the company's resources. This often translates to better user experiences (customers feel the company is attentive; employees feel supported).
- **Data Gathering and Learning:** Each interaction with the chatbot also serves the goal of gathering useful data – what questions people ask, where they face issues, what they are interested in. These insights feed back into improving services and making informed business decisions. The chatbot essentially functions as a two-way channel: providing information to users and capturing user data/feedback for the business. Over time, this helps refine the chatbot's own knowledge (learning from new questions) and guides the company in product improvements or content to add in the knowledge base.

In summary, the overall goals of Shivohini's chatbot solutions span providing **excellent customer service, driving sales, supporting internal operations, and leveraging AI as an expert assistant** in various domains. The consistent theme is using AI to augment or replace routine human interactions in a beneficial way: faster responses, personalized service, reduced workload, and insightful data generation.

Chatbot Interaction Modes: Text vs Voice

Shivohini's AI chatbots are designed to operate in both text and voice modes, offering a flexible user experience depending on the context and user preference. While the underlying capabilities remain the same, there are differences in how the chatbot behaves and is experienced in each mode:

- **Text Mode Behavior:** In text mode, users interact by typing (or tapping selection buttons) and the AI responds with written text (often supplemented by rich content like images, quick-reply buttons, or links if the interface allows).
- The conversation is persistent on screen, allowing users to scroll back and reread previous answers. This is helpful for complex instructions or addresses, where the user might need to double-check what the bot said.
- The bot can provide clickable elements in text mode. For example, if a user asks for a location, the bot might send a Google Maps link. If a user wants to compare products, the bot can present a small table or list since the text interface can show formatted content.
- Users can input at their own pace, and the bot typically waits for the user to finish their question or choose an option before responding (though it may have typing indicators or prompts to guide the user if they pause too long).
- Error handling in text mode often includes suggesting possible commands or clarifying questions if the bot didn't understand the input, since it can't rely on voice tone or inflection.

- **Voice Mode Behavior:** In voice mode, the interaction is through spoken language – the user speaks to the AI and the AI replies with synthesized speech.
- **Speech Recognition:** The chatbot employs speech-to-text to convert the user's spoken words into text that the AI can understand. It handles nuances like accent or pronunciation by leveraging robust speech recognition engines. For example, it's tuned to understand common accents in the Indian and Gulf context, given Shivohini's target regions.
- **Natural Conversational Flow:** The chatbot in voice mode aims to mimic a natural conversation. It might support barge-in (where the user can interrupt the AI's speech with a new query, and the AI will stop talking to listen). It also might use short affirmative sounds ("mm-hmm") to acknowledge a long user statement in certain systems, though typically it processes after the user finishes speaking.
- **Audio Responses:** The AI's replies are converted to audible speech via text-to-speech (TTS). The voice is chosen to be clear and pleasant. In many cases, it can be configured to use a localized accent or even switch languages mid-conversation if the user does so. For instance, the user could ask in Hindi, and the AI will detect that and respond in Hindi voice.
- **Differences in Content Delivery:** In voice mode, the AI avoids long monologues since it's harder for users to retain spoken information compared to reading text. So answers may be more concise, or broken into chunks. If a lot of information is needed, the AI might offer to send a text summary or email ("I'll send the full list of instructions to your email for reference."). It also uses confirmatory prompts more often in voice: e.g., after giving an address verbally, it may ask "Did you get that, or should I repeat?" to ensure understanding.
- **Command Mode (for Interactive Websites):** As described in the Interactive Website section, in voice mode the chatbot can interpret not just Q&A but also direct commands like "Open the services page" or "Play the introduction video." In those cases the behavior is to perform an action (navigate or play media) rather than speak a long answer. It will still verbally acknowledge ("Opening the Services page now").
- **Multimodal Feedback:** If the voice interaction is happening on a screen (e.g., on a website or kiosk), the chatbot often provides visual feedback to accompany the voice. For example, if it's listing options, it might also display a numbered list on screen while speaking them. Or highlight an element as it speaks about it.
- **Continuous Listening vs Push-to-talk:** Depending on the application, the voice mode might be always listening (like a smart speaker where you say a wake-word) or push-to-talk (like you press a microphone icon, speak, then it processes). Shivohini's implementations on websites likely use a push-to-talk model to avoid accidental activations, whereas a dedicated device (if any) might use wake-word activation.
- **Context Persistence:** Both modes share the same backend, so context is maintained regardless of mode. A user could even switch modes mid-session (some interfaces allow seamlessly going from typing to speaking). The chatbot remembers past context in the conversation, so if you typed, "Show my last

order,” then hit a voice button and said “when will it arrive?”, the AI knows “it” refers to the last order.

- **Error Recovery:** In voice mode, errors can happen due to mishearing. The bot might include logic like repeating back what it understood: “Did you say you want to *cancel* the order?” This allows the user to correct it. In text mode, the misinterpretation is less likely at input (since user typed explicitly), but misunderstandings of intent can still occur, and the bot would clarify similarly via text.
- **User Guidance:** In a voice-only scenario (like on a phone call), the AI periodically provides guidance like “You can ask about your account balance or say ‘help’ to hear options.” In text, the main menu or hints can be persistently shown or easily scrolled to. So voice interactions rely more on such verbal nudges to help the user along if they seem lost.

Overall, the chatbot strives to make both modes intuitive. Text mode offers the precision and visual richness, whereas voice mode offers the convenience of hands-free, eyes-free interaction. The choice often depends on context – voice mode is excellent for when users cannot or prefer not to type (e.g., driving, or for accessibility reasons), and text mode is good for when users need to copy details or use a quiet environment.

From a technical standpoint, Shivohini’s chatbot ensures parity of knowledge and function in both modes. The difference lies in interface: how the content is delivered or received. By supporting both, the solutions cater to a wider range of user preferences and needs.

Voice-First Design and Accessibility Features

Shivohini TechAI places strong emphasis on **voice-first user experience** and making its AI solutions accessible to all users, including those with disabilities or special requirements. The design philosophy is to ensure interacting with the AI is as natural as having a conversation, and that no user is left out due to technological barriers. Key features and considerations include:

- **Voice-First UX:** The systems are designed to allow voice commands to accomplish virtually any navigation or action that a user could do via touch or click. Users can say things like “Jump to pricing section” or “Show me the FAQs page,” and the system will instantly navigate there. This reduces the friction of manually clicking through menus or scrolling long pages. Voice becomes the primary mode of driving the interface, not an afterthought.
- The interface provides **visual feedback for voice actions**. For example, if a user says “Scroll down,” the page will scroll and perhaps a subtle highlight might indicate where new content appeared. If the user says “Open contact form,” the form opens and maybe an outline glow confirms it.
- Complex commands in natural language are supported. Users need not memorize exact phrases. The NLU engine interprets intent. For instance, a user could say, “I want to learn about your AI Marketing Manager product” in one go,

and the system will infer to navigate to that section or pull up info, versus requiring a rigid command.

- There is an implicit understanding of context in voice. If the user is currently viewing a particular section and says “Give me more details,” the AI knows to elaborate on that section’s topic (this mixes context retention with voice UX).
- **Hands-Free Mode:** For scenarios where the user can’t use their hands (driving, or a user with limited mobility), the voice-first design enables full hands-free operation. Coupled with wake-word detection (if implemented on a device or an app), a user might not even need to click a microphone icon – they could say “Hello Shivohini” (for example) to activate listening, then command the system. This helps users who have difficulty with fine motor skills or those multitasking.
- **Accessibility – Visual Impairment:** The AI systems incorporate features for users with visual impairments:
 - **Text-to-Speech Everywhere:** Any textual content can be read aloud by the AI with natural TTS. As noted, the Interactive Website will read content if asked. This means a blind user can navigate a website by voice and also consume its content by having it spoken. It’s like the AI combines the roles of screen reader and assistant in one.
 - **Clear Voice and Language Switching:** The voice used is clear, moderately paced, and the AI can switch languages or speak bilingual content, which is helpful as sometimes visually impaired users in multilingual societies might speak multiple languages (the AI will use the one they’re comfortable with, given its multilingual nature).
 - **Non-visual Confirmation:** Instead of relying on visual cues alone, the system provides spoken confirmations. For example, if a form was submitted by voice command, it will say “Your form has been submitted successfully” instead of just showing a message on screen.
- **Accessibility – Hearing Impairment:** For users who are deaf or hard of hearing, the text mode (with real-time transcription of voice input perhaps) is available. If a live voice call with the AI is happening (like a calling assistant scenario), having an option to switch to text chat or get transcriptions can help. Shivohini’s lecture transcription for education is one example of how transcription aids those with hearing difficulties. Similarly, any voice output from the AI can be simultaneously shown as captions on a screen if needed.
- **Multi-Language Support:** Accessibility extends to language as well – speaking a user’s preferred language is crucial for inclusivity. Shivohini’s AI is *truly multilingual* and can operate in any language required. This includes understanding voice commands in different languages and responding accordingly. For example, a user could speak to the chatbot in Arabic, and it will process that and answer in Arabic. This lowers the barrier for non-English speakers or regions where multiple languages are spoken. Users can even

switch languages on the fly; the AI can handle a conversation that starts in English and then answer the next question in Hindi if the user switches.

- **Adaptability for Different Devices:** Voice-first and accessible design means the interface elements scale and adapt whether it's on a large desktop, a tablet, or a small smartphone screen. Buttons and text are readable, and important interactive elements are easily focusable (for screen readers or keyboard navigation). The technology is tested on common browsers and assistive technologies to ensure compatibility.
- **Inclusive Design Testing:** Shivohini likely involves users with disabilities in testing phases or follows standards like WCAG (Web Content Accessibility Guidelines) to ensure its solutions meet compliance. Features like high contrast mode or alternative text for images might be part of the web integrations, although those are more static design elements, the AI chatbot widget should not introduce barriers (e.g., all its functionalities should be accessible via keyboard only for someone who cannot use a mouse).
- **Use Case Example of Accessibility:** Imagine a scenario with a blind user visiting a bank's website that has Shivohini's interactive assistant:
 - The user says, "*Check account balance*" into their computer's microphone. The AI logs in via voice authentication or after prompting for a secure PIN, then **speaks the balance aloud**: "Your current balance is ₹50,000".
 - The user wants to navigate the site, so they say "*Go to loan services section*". The site scrolls and the AI voice says, "Loan Services section" as it does so, effectively giving an audio cue of navigation.
 - The user might ask, "*What are the interest rates?*" The AI reads out the interest rate table for loans. If it's too much, the user can interrupt and ask for just a specific part, e.g., "*What about home loan interest rate?*" – the AI will focus and speak that line.
 - This user never had to see the screen or use a mouse; they achieved their goals through voice alone, showing how voice-first design made the service accessible.

In summary, **Voice-First UX and Accessibility** in Shivohini's solutions ensure that the technology can be used by anyone, in any situation: - People with **limited mobility** can use voice instead of touch (hands-free navigation). - People with **visual impairments** can rely on voice feedback and screen reading of content (the AI becomes their eyes). - People with **hearing impairments** have the robust text interface and visual cues (the AI's content is also displayed as text/captions). - **Multilingual users** are accommodated through the AI's language agility. - Every user benefits from the convenience of voice and the thoughtful design that makes interactions simple and natural.

This inclusive approach not only broadens the user base that can comfortably use the chatbot, but also generally improves user experience – often, features designed for accessibility (like voice control or captions) end up being convenient for all users (for example, voice control is great for drivers; captions are useful in noisy environments or

to reinforce understanding). Shivohini TechAI's commitment to these aspects reflects a modern, user-centric design ethos in its AI solutions.
